ARM®-based 32-bit Cortex®-M4F MCU+FPU with 64 to 25 KB Flash, sLib, USB, 2 CANs, 12 timers, 3 ADCs, 13 communication interfaces

Feature

- **Core: ARM®32-bit Cortex®-M4F CPU with FPU**
  - 200 MHz maximum frequency, with a Memory Protection Unit (MPU), single-cycle multiplication and hardware division
  - Floating Point Unit (FPU)
  - DSP instructions
- **Memories**
  - 64 to 256 KBytes of Flash memory
  - sLib: configurable part of main Flash set as a library area with code excutable but secured, non-readable
  - SPIM interface: extra interfacing up to 16 Mbytes of external SPI Flash (as instruction/data memory)
  - Up to 64 KBytes of SRAM
- **Clock, Reset, and Power management**
  - 2.6 V ~ 3.6 V application suppy and I/Os
  - Power on reset (POR)/ low voltage reset (LVR), and power voltage monitor (PVM)
  - 4 to 25 MHz crystal (HEXT)
  - Internal 48 MHz factory-trimmed RC (accuracy 1% at T_A=25 °C, 2.5 % at T_A=-40 to +105 °C), with automatic clock calibration (ACC)
  - Internal 40 kHz RC oscillator (LICK)
  - 32.768 kHz crystal oscillator (LEXT)
- **Low power consumption**
  - Sleep, Deepsleep, and Standby modes
  - V_{BAT} supply for RTC and 42 x 16-bit battery powered registers (BPR)
- **2 x 12-bit 0.5 µs A/D converters, up to 16 channels**
  - Conversion range: 0 V to 3.6 V
  - Dual sample and hold capability
  - Temparature sensor
- **DMA: 12-channel DMA controller**
  - Peripherals supported: timers, ADCs, SDIOs, I²Ss, SPIs, I²Cs, and USARTs
- **Debug mode**
  - Serial wire debug (SWD) and JTAG interface
- **Up to 55 fast I/O Interfaces**
  - 27/39/55 multifunctional and bidirectional I/Os, all mappable to 16 external interrupt vectors and almost 5 V-tolerant
  - All fast I/Os, control registers accessable with f_{AHB} speed
- **Up to 12 Timers**
  - Up to 5 x 16-bit timers + 2 x 32-bit timers; each with 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input.
  - Up to 2 x 16-bit motor control PWM advanced timers with dead-time generator and emergency brake
  - 2 x Watchdog timers
  - SysTick timer: 24-bit downcounter
- **Up to 13 Communication Interfaces**
  - Up to 2 x I²C interfaces (SMBus/PMBus)
  - Up to 5 x USARTs (ISO7816 interface, LIN, IrDA capability, and modem control)
  - Up to 2 x SPIs (can be used as I²S)
  - Up to 2 x CAN interfaces (2.0B Active)
  - USB2.0 full-speed interface supporting Crystal-less
  - SDIO
- **CRC Calculation Unit**
- **96-bit unique ID (UID)**
- **Packages**
  - LQFP64 10x10 mm
  - LQFP64 7x7 mm
  - QFN48 6 x 6 mm
  - QFN32 4x4 mm
- **List of Models**

Internal Flash	Model
256 KBytes	AT32F413RCT7, AT32F413CCT7, AT32F413CCU7, AT32F413KCU7
128 KBytes	AT32F413RBT7, AT32F413CBT7, AT32F413CBU7, AT32F413KBU7
64 KBytes	AT32F413C8T7

Contents

1 System architecture 27

1.1 System overview 28

1.1.1 ARM Cortex®-M4F processor 28

1.1.2 Bit band 29

1.1.3 Interrupt and exception vectors 31

1.1.4 System Tick (SysTick) 34

1.1.5 Reset 34

1.2 List of abbreviations for registers 36

1.3 Device characteristics information 36

1.3.1 Flash memory size register 36

1.3.2 Device electronic signature 36

2 Memory resources 37

2.1 Internal memory address map 37

2.2 Flash memory 38

2.3 SRAM memory 39

2.4 Peripheral address map 39

3 Power control (PWC) 41

3.1 Introduction 41

3.2 Main Features 41

3.3 POR/LVR 42

3.4 Power voltage monitor (PVM) 42

3.5 Power domain 43

3.6 Power saving modes 43

3.7 PWC registers 45

3.7.1 Power control register (PWC_CTRL) 45

3.7.2 Power control/status register (PWC_CTRLSTS) 46

4 Clock and reset management (CRM) 47

4.1 Clock 47

4.1.1 Clock sources 47
4.1.2 System clock 48
4.1.3 Peripheral clock 48
4.1.4 Clock fail detector 49
4.1.5 Auto step-by-step system clock switch 49
4.1.6 Internal clock output 49
4.1.7 Interrupts 49
4.2 Reset 49
4.2.1 System reset 49
4.2.2 Battery powered domain reset 50
4.3 CRM registers 50
4.3.1 Clock control register (CRM_CTRL) 51
4.3.2 Clock configuration register (CRM_CFG) 52
4.3.3 Clock interrupt register (CRM_CLKINT) 54
4.3.4 APB2 peripheral reset register (CRM_APB2RST) 55
4.3.5 APB1 peripheral reset register (CRM_APB1RST) 56
4.3.6 APB peripheral clock enable register (CRM_AHBEN) 57
4.3.7 APB2 peripheral clock enable register (CRM_AHB2EN) 58
4.3.8 APB1 peripheral clock enable register (CRM_AHB1EN) 59
4.3.9 Battery powered domain control register (CRM_BPDC) 60
4.3.10 Control/status register (CRM_CTRLSTS) 61
4.3.11 Additional register1 (CRM_MISC1) 62
4.3.12 Additional register2 (CRM_MISC2) 62
4.3.13 Additional register3 (CRM_MISC3) 63
4.3.14 Interrupt map register (CRM_INTMAP) 63

5 Flash memory controller (FLASH) 64

5.1 Flash memory introduction 64
5.2 Flash memory operation 68
5.2.1 Unlock/lock 68
5.2.2 Erase operation 68
5.2.3 Programming operation 71
5.2.4 Read operation 72
5.3 External memory operation 72
5.4 User system data area operation 72

5.4.1 Unlock/lock 72
5.4.2 Erase operation 72
5.4.3 Programming operation 73
5.4.4 Read operation 74
5.5 Flash memory protection 74
5.5.1 Access protection 75
5.5.2 Erase/program protection 75
5.6 Special functions 76
5.6.1 Security library settings 76
5.7 Flash memory registers 77
5.7.1 Flash performance select register (FLASH_PSR) 77
5.7.2 Flash unlock register (FLASH_UNLOCK) 78
5.7.3 Flash user system data unlock register (FLASH_USD_UNLOCK) 78
5.7.4 Flash status register (FLASH_STS) 78
5.7.5 Flash control register (FLASH_CTRL) 78
5.7.6 Flash address register (FLASH_ADDR) 79
5.7.7 User system data register (FLASH_USD) 79
5.7.8 Erase/program protection status register (FLASH_EPPS) 79
5.7.9 Flash unlock register3 (FLASH_UNLOCK3) 80
5.7.10 Flash select register (FLASH_SELECT) 80
5.7.11 Flash status register3 (FLASH_STS3) 80
5.7.12 Flash control register3 (FLASH_CTRL3) 80
5.7.13 Flash address register3 (FLASH_ADDR3) 81
5.7.14 Flash decrption address register (FLASH_DA) 81
5.7.15 Flash security library status register 0 (SLIB_STS0) 81
5.7.16 Flash security library status register 1 (SLIB_STS1) 82
5.7.17 Flash security library password clear register (SLIB_PWD_CLR) 82
5.7.18 Security library additional status register (SLIB_MISC_STS) 82
5.7.19 Security library password setting register (SLIB_SET_PWD) 83
5.7.20 Security library address setting register (SLIB_SET_RANGE) 83
5.7.21 Security library unlock register (SLIB_UNLOCK) 83
5.7.22 Flash CRC check control register (FLASH_CRC_CTRL) 84
5.7.23 Flash CRC check result register (FLASH_CRC_CHKR) 84

6 General-purpose I/Os (GPIOs) 85

6.1 Introduction 85
6.2 Function overview 85
6.2.1 GPIO structure 85
6.2.2 GPIO reset status 86
6.2.3 General-purpose input configuration 86
6.2.4 Analog input/output configuration 86
6.2.5 General-purpose output configuration 86
6.2.6 I/O port protection 86
6.3 GPIO registers 87
6.3.1 GPIO configuration register low (GPIOx_CFGLR) (x=A..F) 87
6.3.2 GPIO configuration register high (GPIOx_CFGHR) (A..F) 88
6.3.3 GPIO input data register (GPIOx_IDT) (x=A..F) 88
6.3.4 GPIO output data register (GPIOx_ODT) (x=A..F) 88
6.3.5 GPIO set/clear register (GPIOx_SCR) (x=A..F) 89
6.3.6 GPIO clear register (GPIOx_CLR) (x=A..F) 89
6.3.7 GPIO write protection register (GPIOx_WPR) (x=A..F) 89

7 Multiplexed function I/Os (IOMUX) 90

7.1 Introduction 90
7.2 Function overview 90
7.2.1 IOMUX structure 90
7.2.2 Multiplexed input configuration 91
7.2.3 Multiplexed output or bidirectional multiplexed configuration 91
7.2.4 IOMUX map priority 91
7.2.4.1 Hardware preemption 92
7.2.4.2 Debug port priority 92
7.2.4.3 Other peripheral output priority 92
7.2.5 External interrupt/wake-up lines 92
7.3 Multiplexed function IO 93
7.4 IOMUX registers 96
7.4.1 Event output control register (IOMUX_EVTOUT) 97
7.4.2 IOMUX remap register (IOMUX_REMAP) 98
7.4.3 IOMUX external interrupt configuration register1 (IOMUX_EXINTC1) 100
7.4.4 IOMUX external interrupt configuration register2 (IOMUX_EXINTC2) 101
7.4.5 IOMUX external interrupt configuration register3 (IOMUX_EXINTC3) 101

7.4.6 IOMUX external interrupt configuration register4 (IOMUX_EXINTC4) 102
7.4.7 IOMUX remap register2 (IOMUX_REMAP2) 103
7.4.8 IOMUX remap register3 (IOMUX_REMAP3) 103
7.4.9 IOMUX remap register4 (IOMUX_REMAP4) 103
7.4.10 IOMUX remap register5 (IOMUX_REMAP5) 104
7.4.11 IOMUX remap register6 (IOMUX_REMAP6) 104
7.4.12 IOMUX remap register7 (IOMUX_REMAP7) 105

8 External interrupt/Event controller (EXINT) 107

8.1 EXINT introduction 107
8.2 Function overview and configuration procedure 107
8.3 EXINT registers 108
8.3.1 Interrupt enable register (EXINT_INTEN) 108
8.3.2 Event enable register (EXINT_EVTEN) 108
8.3.3 Polarity configuration register1 (EXINT_ POLCFG1) 108
8.3.4 Polarity configuration register2 (EXINT_ POLCFG2) 108
8.3.5 Software trigger register (EXINT_ SWTRG) 109
8.3.6 Interrupt status register (EXINT_ INTSTS) 109

9 DMA controller (DMA) 110

9.1 Introduction 110
9.2 Main features 110
9.3 Function overview 111
9.3.1 DMA configuration 111
9.3.2 Handshake mechanism 111
9.3.3 Arbiter 111
9.3.4 Programmable data transfer width 112
9.3.5 Error events 113
9.3.6 Interrupts 113
9.3.7 Fixed DMA request mapping 113
9.3.8 Flexible DMA request mapping 114
9.4 DMA registers 115
9.4.1 DMA interrupt status register (DMA_STS) 116
9.4.2 DMA interrupt flag clear register (DMA_CLR) 118
9.4.3 DMA channelx configuration register (DMA_CxCTRL) (x = 1...7) 120

9.4.4 DMA channelx number of data register (DMA_CxDTCNT) (x = 1...7)121
9.4.5 DMA channelx peripheral address register (DMA_CxPADDR) (x = 1...7)121
9.4.6 DMA channelx memory address register (DMA_CxMADDR) (x = 1...7)121
9.4.7 Channel source register (DMA_SRC_SEL0)121
9.4.8 Channel source register1 (DMA_SRC_SEL1)122

10 CRC calculation unit (CRC) 123

10.1 CRC introduction 123
10.2 CRC functional description 123
10.3 CRC registers 124
10.3.1 Data register (CRC_DT)124
10.3.2 Common data register (CRC_CDT)124
10.3.3 Control register (CRC_CTRL)125
10.3.4 Initialization register (CRC_IDT)125
10.3.5 Polynomial register (CRC_POLY)125

11 I²C interface 126

11.1 I²C introduction 126
11.2 I²C main features 126
11.3 I²C function overview 126
11.4 I²C interface 127
11.4.1 I²C slave communication flow129
11.4.2 I²C master communication flow131
11.4.3 Utilize DMA for data transfer137
11.4.4 SMBus138
11.4.5 I²C interrupt requests139
11.4.6 I²C debug mode140
11.5 I²C registers 140
11.5.1 Control register1 (I2C_CTRL1)140
11.5.2 Control register2 (I2C_CTRL2)142
11.5.3 Own address register1 (I2C_OADDR1)142
11.5.4 Own address register2 (I2C_OADDR2)143
11.5.5 Data register (I2C_DT)143
11.5.6 Status register1 (I2C_STS1)143

11.5.7 Status register2 (I2C_STS2) 145
11.5.8 Clock control register (I2C_ CLKCTRL) 146
11.5.9 Clock rise time register (I2C_TMRISE) 147

12 Universal synchronous/asynchronous receiver/transmitter (USART) 148

12.1 USART introduction 148
12.2 Full-duplex/half-duplex selector 150
12.3 Mode selector 150
12.3.1 Introduction 150
12.3.2 Configuration procedure 150
12.4 USART frame format and configuration 153
12.5 DMA transfer introduction 155
12.5.1 Transmission using DMA 155
12.5.2 Reception using DMA 155
12.6 Baud rate generation 156
12.6.1 Introduction 156
12.6.2 Configuration 156
12.7 Transmitter 156
12.7.1 Transmitter introduction 156
12.7.2 Transmitter configuration 157
12.8 Receiver 157
12.8.1 Receiver introduction 157
12.8.2 Receiver configuration 158
12.8.3 Start bit and noise detection 159
12.9 Interrupt requests 160
12.10 I/O pin control 160
12.11 USART registers 162
12.11.1 Status register (USART_STS) 162
12.11.2 Data register (USART_DT) 163
12.11.3 Baud rate register (USART_BAUDR) 163
12.11.4 Control register1 (USART_CTRL1) 163
12.11.5 Control register2 (USART_CTRL2) 165
12.11.6 Control register3 (USART_CTRL3) 166
12.11.7 Guard time and divider register (GDIV) 167

13 Serial peripheral interface (SPI) 168
13.1 SPI introduction 168
13.2 Function overview 168
13.2.1 SPI description 168
13.2.2 Full-duplex/half-duplex selector 169
13.2.3 Chip select controller 171
13.2.4 SPI_SCK controller 171
13.2.5 CRC introduction 171
13.2.6 DMA transfer 172
13.2.7 Transmitter 173
13.2.8 Receiver 173
13.2.9 Motorola mode 174
13.2.10 Interrrupts 176
13.2.11 IO pin control 176
13.2.12 Precautions 177
13.3 I²S functional description 177
13.3.1 I²S introduction 177
13.3.2 Operation mode selector 178
13.3.3 Audio protocol selector 179
13.3.4 I2S_CLK controller 180
13.3.5 DMA transfer 183
13.3.6 Transmitter/Receiver 183
13.3.7 I2S communication timings 184
13.3.8 Interrupts 185
13.3.9 IO pin control 185
13.4 SPI registers 186
13.4.1 SPI control register1 (SPI_CTRL1) (Not used in I²S mode) 186
13.4.2 SPI control register2 (SPI_CTRL2) 187
13.4.3 SPI status register (SPI_STS) 188
13.4.4 SPI data register (SPI_DT) 189
13.4.5 SPICRC register (SPI_CPOLY) (Not used in I²S mode) 189
13.4.6 SPIRxCRC register (SPI_RCRC) (Not used in I2S mode) 189
13.4.7 SPITxCRC register (SPI_TCRC) 189
13.4.8 SPI_I2S register (SPI_I2SCTRL) 189

13.4.9 SPI_I2S prescaler register (SPI_I2SCLKP) 190

14 Timer 191

14.1 General-purpose timer (TMR2 to TMR5) 191

14.1.1 TMRx introduction 191

14.1.2 TMRx main features 192

14.1.3 TMRx functional overview 192

14.1.3.1 Counting clock 192

14.1.3.2 Counting mode 196

14.1.3.3 TMR input function 200

14.1.3.4 TMR output function 202

14.1.3.5 TMR synchronization 205

14.1.3.6 Debug mode 208

14.1.4 TMRx registers 208

14.1.4.1 Control register1 (TMRx_CTRL1) 210

14.1.4.2 Control register2 (TMRx_CTRL2) 212

14.1.4.3 Slave timer control register (TMRx_STCTRL) 212

14.1.4.4 DMA/interrupt enable register (TMRx_IDEN) 213

14.1.4.5 Interrupt status register (TMRx_ISTS) 214

14.1.4.6 Software event register (TMRx_SWEVT) 215

14.1.4.7 Channel mode register1 (TMRx_CM1) 216

14.1.4.8 Channel mode register2 (TMRx_CM2) 218

14.1.4.9 Channel control register (TMRx_CCTRL) 219

14.1.4.10 Counter value (TMRx_CVAL) 220

14.1.4.11 Division value (TMRx_DIV) 220

14.1.4.12 Period register (TMRx_PR) 220

14.1.4.13 Channel 1 data register (TMRx_C1DT) 220

14.1.4.14 Channel 2 data register (TMRx_C2DT) 220

14.1.4.15 Channel 3 data register (TMRx_C3DT) 221

14.1.4.16 Channel 4 data register (TMRx_C4DT) 221

14.1.4.17 DMA control register (TMRx_DMACTRL) 221

14.1.4.18 DMA data register (TMRx_DMADT) 222

14.2 General-purpose timer (TMR9 to TMR11) 222

14.2.1 TMRx introduction 222

14.2.2 TMRx main features 222

14.2.2.1 TMR9 main features 222

14.2.2.2 TMR10 and TMR11 main features 222

14.2.3 TMRx functional overview 223
14.2.3.1 Counting clock 223
14.2.3.2 Counting mode 225
14.2.3.3 TMR input function 226
14.2.3.4 TMR output function 228
14.2.3.5 TMR synchronization 231
14.2.3.6 Debug mode 232
14.2.4 TMR9 registers 232
14.2.4.1 Control register1 (TMR9_CTRL1) 232
14.2.4.2 Slave timer control register (TMR9_STCTRL) 234
14.2.4.3 DMA/interrupt enable register (TMR9_IDEN) 234
14.2.4.4 Interrupt status register (TMR9_ISTS) 235
14.2.4.5 Software event register (TMR9_SWEVT) 235
14.2.4.6 Channel mode register1 (TMR9_CM1) 236
14.2.4.7 Channel control register (TMR9_CCTRL) 238
14.2.4.8 Counter value (TMR9_CVAL) 239
14.2.4.9 Division value (TMR9_DIV) 239
14.2.4.10 Period register (TMR9_PR) 239
14.2.4.11 Channel 1 data register (TMR9_C1DT) 239
14.2.4.12 Channel 2 data register (TMR9_C2DT) 239
14.2.5 TMR10 and TMR11 registers 240
14.2.5.1 Control register1 (TMRx_CTRL1) 240
14.2.5.2 DMA/interrupt enable register (TMRx_IDEN) 241
14.2.5.3 Interrupt status register (TMRx_ISTS) 241
14.2.5.4 Software event register (TMRx_SWEVT) 241
14.2.5.5 Channel mode register1 (TMRx_CM1) 242
14.2.5.6 Channel control register (TMRx_CCTRL) 244
14.2.5.7 Counter value (TMRx_CVAL) 244
14.2.5.8 Division value (TMRx_DIV) 244
14.2.5.9 Period register (TMRx_PR) 244
14.2.5.10 Channel 1 data register (TMRx_C1DT) 244
14.3 Advanced-control timers (TMR1 and TMR8) 245
14.3.1 TMR1 and TMR8 introduction 245
14.3.2 TMR1 and TMR8 main features 245
14.3.3 TMR1 and TMR8 functional overview 245
14.3.3.1 Counting clock 245
14.3.3.2 Counting mode 248
14.3.3.3 TMR input function 253

14.3.3.4 TMR output function 256
14.3.3.5 TMR break function 260
14.3.3.6 TMR synchronization 261
14.3.3.7 Debug mode 262
14.3.4 TMR1 and TMR8 registers 263
14.3.4.1 TMR1 and TMR8 control register1 (TMRx_CTRL1) 263
14.3.4.2 TMR1 and TMR8 control register2 (TMRx_CTRL2) 264
14.3.4.3 TMR1 and TMR8 slave timer control register (TMRx_STCTRL) . 266
14.3.4.4 TMR1 and TMR8 DMA/interrupt enable register (TMRx_IDEN) .. 267
14.3.4.5 TMR1 and TMR8 interrupt status register (TMRx_ISTS) 268
14.3.4.6 Software event register (TMRx_SWEVT) 269
14.3.4.7 TMR1 and TMR8 channel mode register1 (TMRx_CM1) 270
14.3.4.8 Channel mode register2 (TMRx_CM2) 272
14.3.4.9 Channel control register (TMRx_CCTRL) 273
14.3.4.10 TMR1 and TMR8 counter value (TMRx_CVAL) 275
14.3.4.11 TMR1 and TMR8 division value (TMRx_DIV) 275
14.3.4.12 TMR1 and TMR8 period register (TMRx_PR) 275
14.3.4.13 TMR1 and TMR8 repetition period register (TMRx_RPR) 275
14.3.4.14 TMR1 and TMR8 channel 1 data register (TMRx_C1DT) 275
14.3.4.15 TMR1 and TMR8 channel 2 data register (TMRx_C2DT) 276
14.3.4.16 TMR1 and TMR8 channel 3 data register (TMRx_C3DT) 276
14.3.4.17 TMR1 and TMR8 channel 4 data register (TMRx_C4DT) 276
14.3.4.18 TMR1 and TMR8 break register (TMRx_BRK) 276
14.3.4.19 TMR1 and TMR8 DMA control register (TMRx_ DMACTRL) .. 278
14.3.4.20 TMR1 and TMR8 DMA data register (TMRx_ DMADT) 278

15 Window watchdog timer (WWDT) 279

15.1 WWDT introduction 279
15.2 WWDT main features 279
15.3 WWDT functional overview 279
15.4 Debug mode 280
15.5 WWDT registers 280
15.5.1 Control register (WWDT_CTRL) 280
15.5.2 Configuration register (WWDT_CFG) 281
15.5.3 Status register (WWDT_STS) 281

16 Watchdog timer (WDT) 282

16.1 WDT introduction 282
16.2 WDT main features 282
16.3 WDT functional overview 282
16.4 Debug mode 283
16.5 WDT registers 283
16.5.1 Command register (WDT_CMD) 284
16.5.2 Divider register (WDT_DIV) 284
16.5.3 Reload register (WDT_RLD) 284
16.5.4 Status register (WDT_STS) 284

17 Real-time clock (RTC) 285

17.1 RTC introduction 285
17.2 RTC main features 285
17.3 RTC structure 285
17.4 RTC functional overview 286
17.4.1 Configuring RTC registers 286
17.4.2 Reading RTC registers 287
17.4.3 RTC interrupts 287
17.5 RTC registers 288
17.5.1 RTC control register high (RTC_CTRLH) 288
17.5.2 RTC control register low (RTC_CTRLL) 289
17.5.3 RTC divider register (RTC_ DIVH/RTC_DIVL) 289
17.5.4 RTC divider counter register (RTC_ DIVCNTH/RTC_DIVCNTL) 290
17.5.5 RTC counter value register (RTC_CNTH/RTC_CNTL) 290
17.5.6 RTC alarm register (RTC_TAH/RTC_TAL) 290

18 Battery powered registers (BPR) 291

18.1 BPR introduction 291
18.2 BPR main features 291
18.3 BPR functional overview 291
18.4 BPR registers 291
18.4.1 Battery powered data register x (BPR_DTx) (x = 1 ... 42) 292
18.4.2 RTC calibration register (BPR_ RTCCAL) 293
18.4.3 BPR control register (BPR_ CTRL) 293

18.4.4 BPR control/status register (BPR_ CTRLSTS) 294

19 Analog-to-digital converter (ADC) 295

19.1 ADC introduction 295

19.2 ADC main features 295

19.3 ADC structure 295

19.4 ADC functional overview 297

19.4.1 Channel management 297

19.4.1.1 Internal temperature sensor 297

19.4.1.2 Internal reference voltage 297

19.4.2 ADC operation process 298

19.4.2.1 Power-on and calibration 298

19.4.2.2 Trigger 299

19.4.2.3 Sampling and conversion sequence 300

19.4.3 Conversion sequence management 300

19.4.3.1 Sequence mode 300

19.4.3.2 Automatic preempted group conversion mode 301

19.4.3.3 Repetition mode 301

19.4.3.4 Partition mode 302

19.4.4 Data management 303

19.4.4.1 Data alignment 303

19.4.4.2 Data read 303

19.4.5 Voltage monitoring 303

19.4.6 Status flag and interrupts 303

19.5 Master/Slave mode 304

19.5.1 Data management 304

19.5.2 Regular simultaneous mode 304

19.5.3 Interleaved trigger mode of preempted group 305

19.5.4 Shift mode of regular group 306

19.6 ADC registers 307

19.6.1 ADC status register (ADC_STS) 308

19.6.2 ADC control register1 (ADC_CTRL1) 308

19.6.3 ADC control register2 (ADC_CTRL2) 310

19.6.4 ADC sampling time register 1 (ADC_SPT1) 312

19.6.5 ADC sampling time register 2 (ADC_SPT2) 313

19.6.6 ADC preempted channel data offset register x (ADC_PCDTOx) (x=1..4) 315
19.6.7 ADC voltage monitor high threshold register (ADC_VWHB) 315
19.6.8 ADC voltage monitor low threshold register (ADC_VWLB) 315
19.6.9 ADC ordinary sequence register 1 (ADC_OSQ1) 315
19.6.10 ADC ordinary sequence register 2 (ADC_OSQ2) 316
19.6.11 ADC ordinary sequence register 3 (ADC_OSQ3) 316
19.6.12 ADC preempted sequence register (ADC_PSQ) 316
19.6.13 ADC preempted data register x (ADC_PDTx) (x=1..4) 317
19.6.14 ADC ordinary data register (ADC_ODT) 317

20 CAN 318

20.1 CAN introduction 318
20.2 CAN main features 318
20.3 Baud rate configuration 318
20.4 Interrupt management 321
20.5 Design tips 322
20.6 Function overview 322
20.6.1 General functional description 322
20.6.2 Operating modes 323
20.6.3 Test modes 323
20.6.4 Message filtering 324
20.6.5 Message transmission 326
20.6.6 Message reception 328
20.6.7 Error management 329
20.7 CAN registers 329
20.7.1 CAN control and status registers 330
20.7.1.1 CAN master control register (CAN_MCTRL) 330
20.7.1.2 CAN master status register (CAN_MSTS) 332
20.7.1.3 CAN transmit status register (CAN_TSTS) 333
20.7.1.4 CAN receive FIFO 0 register (CAN_RF0) 337
20.7.1.5 CAN receive FIFO 1 register (CAN_RF1) 337
20.7.1.6 CAN interrupt enable register (CAN_INTEN) 338
20.7.1.7 CAN error status register (CAN_ESTS) 340
20.7.1.8 CAN bit timing register (CAN_BTMG) 341
20.7.2 CAN mailbox registers 341

20.7.2.1 Transmit mailbox identifier register (CAN_TMIx) (x=0..2) 342
20.7.2.2 Transmit mailbox data length and time stamp register (CAN_TMCx) (x=0..2) 342
20.7.2.3 Transmit mailbox data low register (CAN_TMDTLx) (x=0..2) 343
20.7.2.4 Transmit mailbox data high register (CAN_TMDTHx) (x=0..2) ... 343
20.7.2.5 Receive FIFO mailbox identifier register (CAN_RFIx) (x=0..1) .. 343
20.7.2.6 Receive FIFO mailbox data length and time stamp register (CAN_RFCx) (x=0..1) 343
20.7.2.7 Receive FIFO mailbox data low register (CAN_RFDTLx) (x=0..1)344
20.7.2.8 Receive FIFO mailbox data high register (CAN_RFDTHx) (x=0..1)344
20.7.3 CAN filter registers 344
20.7.3.1 CAN filter control register (CAN_FCTRL) 344
20.7.3.2 CAN filter mode configuration register (CAN_FMCFG) 344
20.7.3.3 CAN filter bit width configuration register (CAN_ FBWCFG)..... 344
20.7.3.4 CAN filter FIFO association register (CAN_ FRF) 345
20.7.3.5 CAN filter activation control register (CAN_ FACFG)..... 345
20.7.3.6 CAN filter bank i filter bit register (CAN_ FiFBx) (i=0..13; x=1..2)345

21 Universal serial bus full-seed device interface (USBFS)..... 346

21.1 USBFS introduction..... 346
21.2 USBFS clock and pin configuration..... 346
21.2.1 USB clock configuration.....346
21.2.2 USB pin configuration.....346
21.3 USBFS functional description..... 346
21.3.1 USB initialization.....346
21.3.2 Endpoint configuration.....347
21.3.3 USB buffer.....347
21.3.4 Double-buffered endpoints.....348
21.3.5 SOF output 349
21.3.6 Suspend/Resume 349
21.4 USB interrupts..... 349
21.5 USBFS registers..... 349
21.5.1 USBFS endpoint n register (USBFS_EPTn), n=[0..7] 350
21.5.2 USBFS control register (USBFS_CTRL).....351
21.5.3 USBFS interrupt status register (USBFS_INTSTS) 352
21.5.4 USBFS SOF frame number register (USBFS_SOFRNUM) 353

21.5.5 USBFS device address register (USBFS_DEVADDR) 353
21.5.6 USBFS buffer table address register (USBFS_BUFTBL) 353
21.5.7 USBFS CFG control register (USBFS_CFG).....353
21.5.8 USBFS transmission buffer first address register (USBFS_TnADDR)354
21.5.9 USBFS transmission data length register (USBFS_TnLEN) 354
21.5.10 USBFS reception buffer first address register (USBFS_RnADDR)354
21.5.11 USBFS reception data length register (USBFS_RnLEN).....354

22 HICK auto clock calibration (ACC) 355

22.1 ACC introduction 355
22.2 Main features 355
22.3 Interrupt requests 355
22.4 Functional description 356
22.5 Principle..... 357
22.6 Register description 358
22.6.1 Status register (ACC_STS) 358
22.6.2 Control register 1 (ACC_CTRL1) 359
22.6.3 Control register 2 (ACC_CTRL2) 360
22.6.4 Compare value 1 (ACC_C1) 360
22.6.5 Compare value 2 (ACC_C2) 360
22.6.6 Compare value 3 (ACC_C3) 360

23 SDIO interface..... 361

23.1 SDIO introduction 361
23.2 SDIO main features..... 361
23.3 SDIO main features..... 363
23.3.1 Card functional description 363
23.3.1.1 Card identification mode..... 363
23.3.1.2 Data transfer mode 364
23.3.1.3 Erase..... 365
23.3.1.4 Protection management..... 365
23.3.2 Commands and responses 368
23.3.2.1 Commands 368
23.3.2.2 Response formats 372
23.3.3 SDIO functional description 374

23.3.3.1 SDIO adapter 375
23.3.3.2 Data BUF 379
23.3.3.3 SDIO AHB interface 379
23.3.3.4 Hardware flow control 380
23.3.4 SDIO I/O card-specific operations 380
23.4 SDIO registers 381
23.4.1 SDIO power control register (SDIO_ PWRCTRL) 381
23.4.2 SDIO clock control register (SDIO_ CLKCTRL) 382
23.4.3 SDIO argument register (SDIO_ARG) 383
23.4.4 SDIO command register (SDIO_CMD) 383
23.4.5 SDIO command response register (SDIO_RSPCMD) 384
23.4.6 SDIO response 1..4 register (SDIO_RSPx) 384
23.4.7 SDIO data timer register (SDIO_DTTMR) 384
23.4.8 SDIO data length register (SDIO_DTLEN) 384
23.4.9 SDIO data control register (SDIO_DTCTRL) 385
23.4.10 SDIO data counter register (SDIO_DTCNTR) 386
23.4.11 SDIO status register (SDIO_STS) 386
23.4.12 SDIO clear interrupt register (SDIO_INTCLR) 387
23.4.13 SDIO interrupt mask register (SDIO_INTEN) 388
23.4.14 SDIOBUF counter register (SDIO_BUFCNTR) 390
23.4.15 SDIO data BUF register (SDIO_BUF) 390

24 Debug (DEBUG) 391

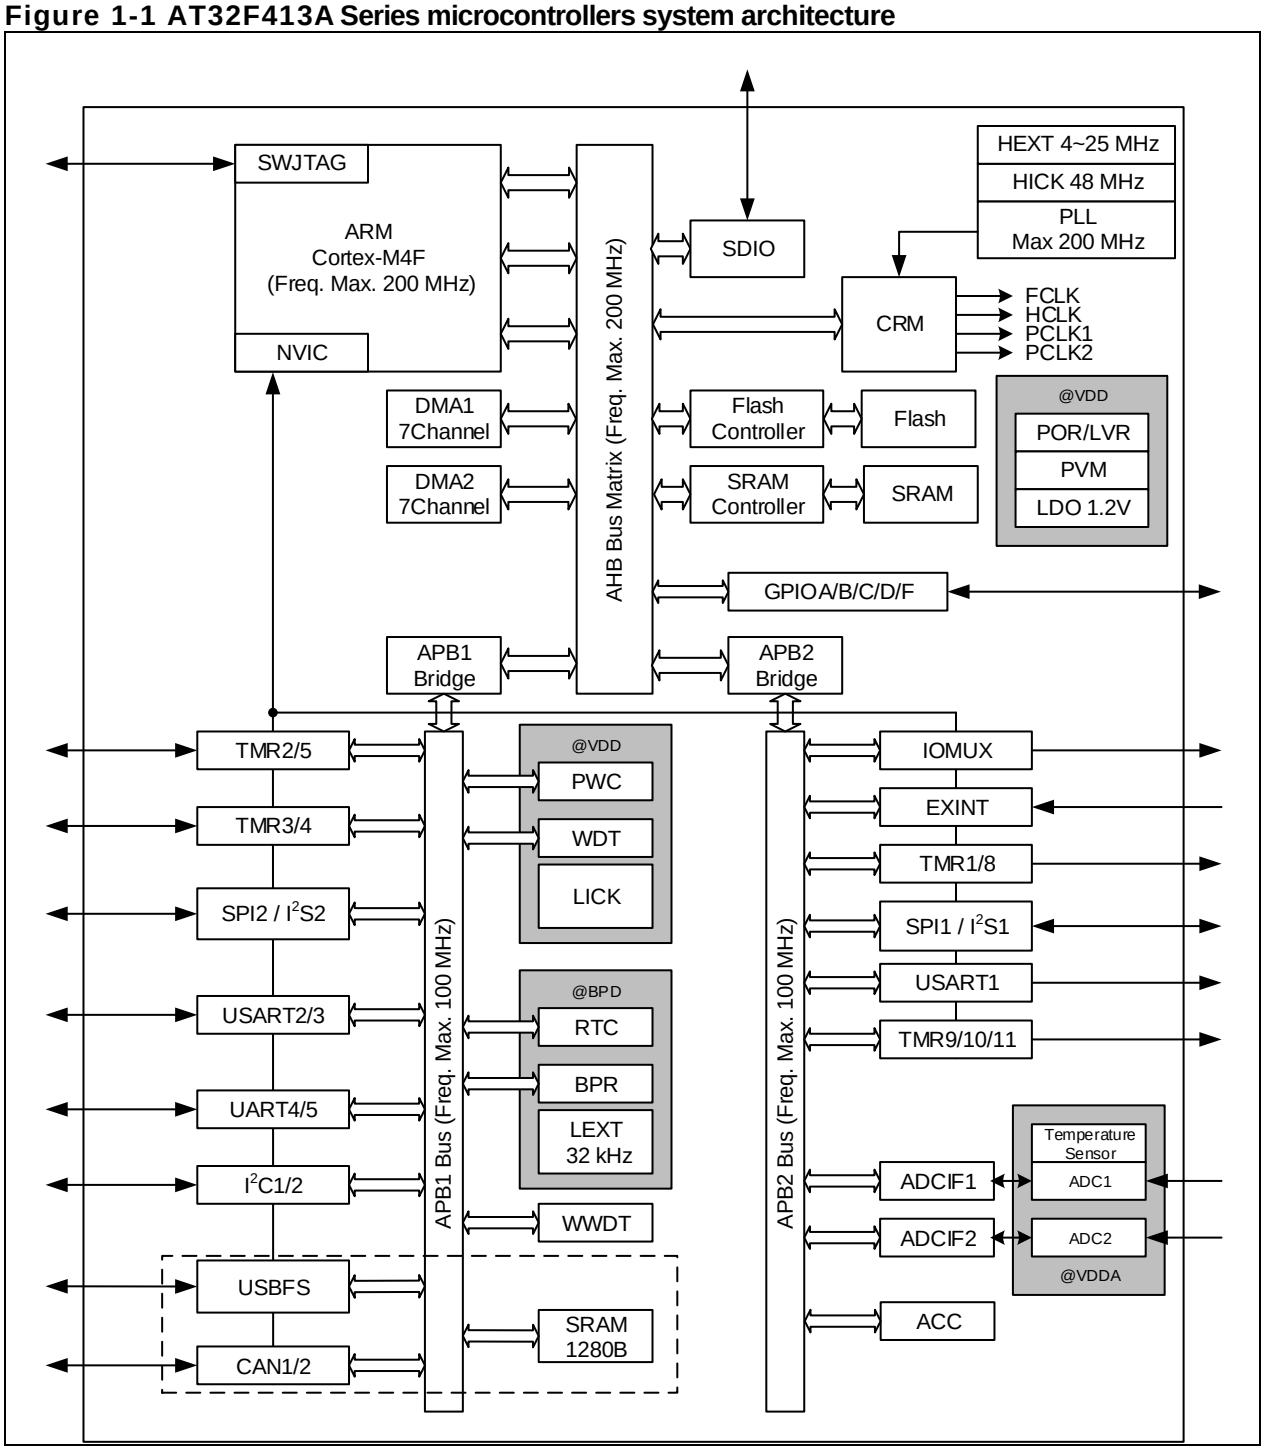
1 System architecture

AT32F413 series microcontrollers consist of 32-bit ARM® Cortex®-M4F processor, multiple 16-bit and 32-bit timers, DMA controller, RTC, communication interfaces such as SPI, I2C, USART/UART and SDIO, CAN, USB2.0 full-speed interface, automatic clock calibration (ACC), 12-bit ADC, programmable voltage monitor (PVM) and other peripherals. The device contains a wide range of peripherals and memories. Cortex®-M4F processer supports enhanced high-performance DSP instruction set, including extended single cycle 16-bit/32-bit multiply accumulater (MAC), dual 16-bit MAC instruction, optimized 8-bit/16-bit SIMD operation and saturation operation instruction, and single-precision (IEEE-754) float point unit (FPU), as shown in *Figure 1-1*:

Figure 1-1 AT32F413A Series microcontrollers system architecture



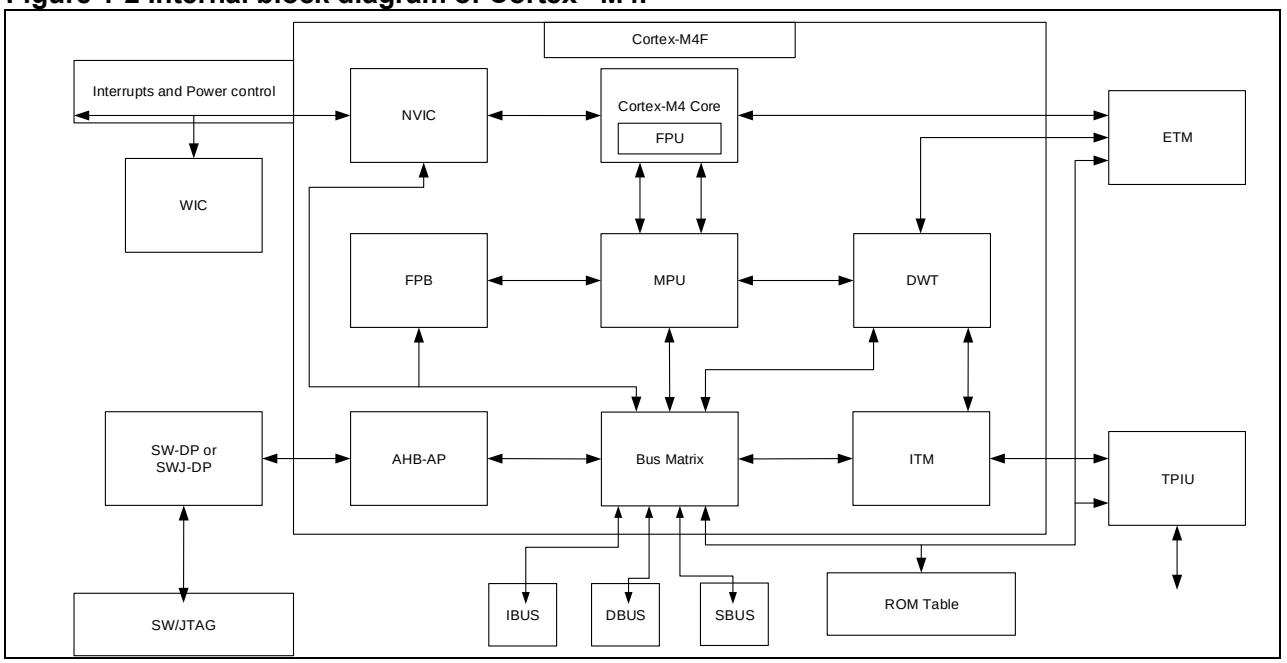
1.1 System overview

1.1.1 ARM Cortex®-M4F processor

Cortex®-M4F processor is a low power consumption processor featuring low gate count, low interrupt latency, and low-cost debug. It supports DSP instruction set and FPU, and is particularly suitable for deeply-embedded applications that require quicker response to interruption. Cortex®-M4F processor is based on ARMv7-M architecture, supporting both Thumb instruction set and DSP instruction set.

Figure 1-2 shows the internal block diagram of Cortex®-M4F processor. Please refer to *ARM Cortex® -M4 Technical Reference Manual* for more information.

Figure 1-2 Internal block diagram of Cortex®-M4F



1.1.2 Bit band

By using bit-band regions, read and write access to a single bit can be performed through common load/store operations. The Cortex®-M4F memory includes two bit-band regions: the lowest 1MByte of SRAM and the lowest 1MByte of peripherals. In addition to access to bit-band addresses, their respective bit-band alias area can be used to access to any bit of any address. The bit-band alias area transforms each bit into a 32-bit word. Thus, accessing to one bit in the alias area has the same effect as read-modify-write operation on the bit in the bit-band region.

Figure 1-3 Comparison between bit-band region and its alias region: image A

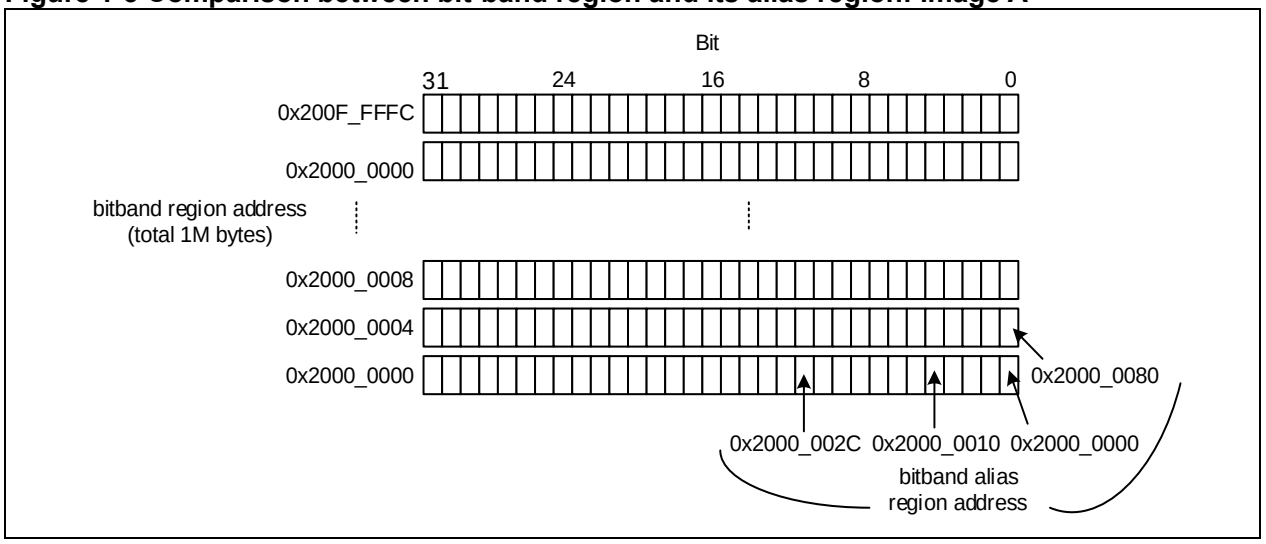


Figure 1-4 Comparison between bit-band region and its alias region: image B

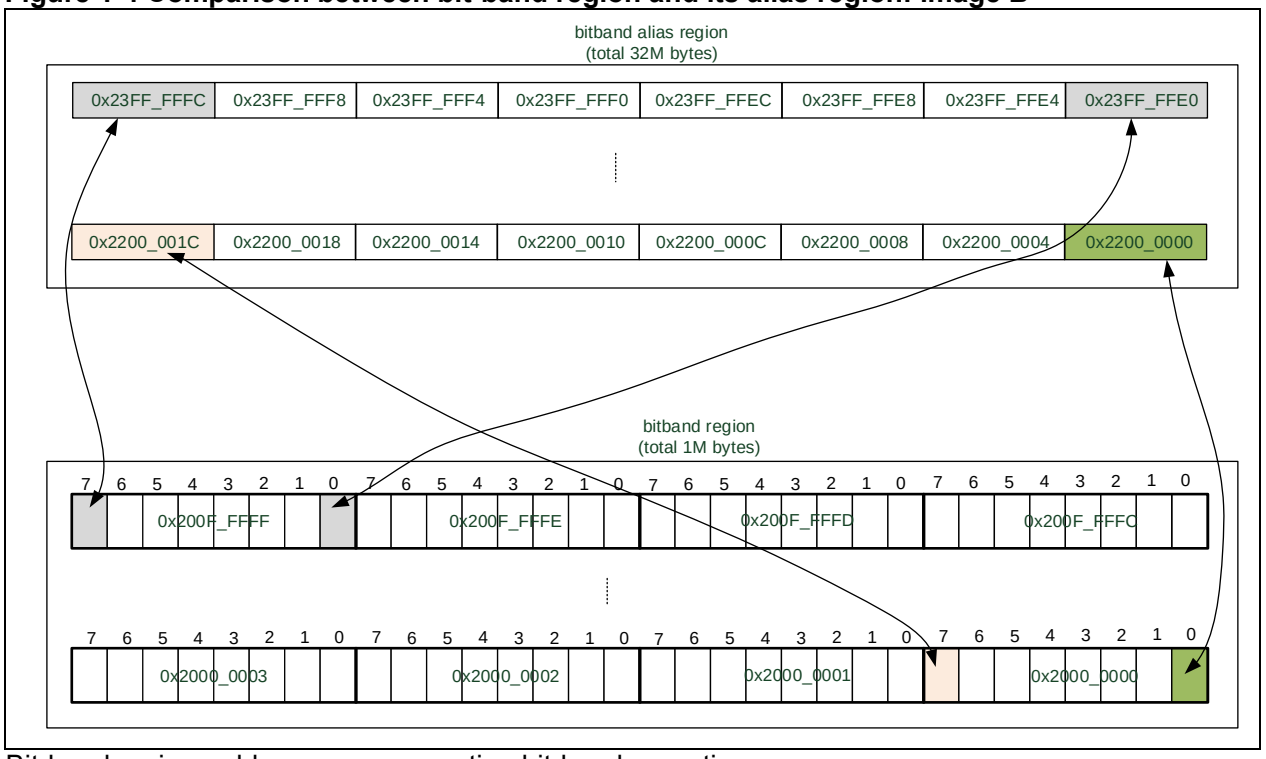

Bit-band region: address area supporting bit-band operations

Bit-band alias region: access to the alias region has the same effect as read-modify-write operation on the bit-band region

Each bit in the bit-band region is mapped into a word (LSB) of the alias region. When accessing to the address in the bit-band alias region, such address is transformed into the bit-band address. For a read operation, read one word in the bit-band region, then move the required bit to the right to LSB, and then return the LSB. For a write opearation, first move the targeted bit to the left to the corresponding bit number, then perform read-modify-write operation on bit level.

The address ranges of two Flash memories supporting bit-band operations:

The lowest 1 Mbyte of the SRAM: 0x2000_0000~0x200F_FFFF

The lowest 1 Mbyte of peripherals: 0x4000_0000~0x400F_FFFF

For a bit in the SRAM bit-band region, if the byte address is A, the bit number is n (0<=n<=7), then the alias address where the bit is :

AliasAddr = 0x2200_0000+ (A-0x2000_0000)*32+n*4

For a bit in the peripheral bit-band region, if the byte address is A, the bit number is n (0<=n<=7), then the alias address where the bit is:

AliasAddr = 0x4200_0000+ (A-0x4000_0000)*32+n*4

Table 1-1 shows the mapping between bit-band region and alias region in SRAM:

Table 1-1 Bit-band address mapping in SRAM

Bit-band region	Equivalent alias address
0x2000_0000.0	0x2200_0000.0
0x2000_0000.1	0x2200_0004.0
0x2000_0000.2	0x2200_0008.0
…	…
0x2000_0000.31	0x2200_007C.0

0x2000_0004.1	0x2200_0084.0
0x2000_0004.2	0x2200_0088.0
…	…
0x200F_FFFC.31	0x23FF_FFFC.0

Table 1-2 shows the mapping between bit-band region and alias region in peripheral area:

Table 1-2 Bit-band address mapping in the peripheral area

Bit-band region	Equivalent alias address
0x4000_0000.0	0x4200_0000.0
0x4000_0000.1	0x4200_0004.0
0x4000_0000.2	0x4200_0008.0
…	…
0x4000_0000.31	0x4200_007C.0
0x4000_0004.0	0x4200_0080.0
0x4000_0004.1	0x4200_0084.0
0x4000_0004.2	0x4200_0088.0
…	…
0x400F_FFFC.31	0x43FF_FFFC.0

In terms of bit-band operation, one of the advantages is to control LED ON/OFF independently via GPIO pins. On the other hand, it brings great conveninence for serial interface operations. In short, it is best suited to hardware I/O-intensive low-level applications.

In addition, bit-band operations can also simplify jump process. When jump operation is based on a bit level, the previous steps are:

- Read the whole register

- Mask the undesired bits
- Compare and jump

For now, you just need:

- Read the bit status from the bit-band alias region
- Compare and jump

Apart from making code more concise, its important function is also reflected in multi-task environment. When it comes to multiples taks, it turns the read-modify-write operations into a hardware-supported atomic operation to avoid the scenario where the read-modify-write opearion is disrupted, resulting in disorder.

1.1.3 Interrupt and exception vectors

Table 1-3 AT32F413 series vector table

Pos.	Priority	Priority Type	Name	Description	Address
	-	-	-	Reserved	0x0000_0000

75	82	Configurable	DMA2 channel 6_7	DMA2 channel6 and DMA2 channel7 global interrupt	0x0000_016C

Note: 1. USBFS module interrupt supports remap through the USBINTMAP bit in the CRM_INTMAP register. When USBINTMAP=0, use USBFS_H (19th) and USBFS_ L (20th) interrupts; when USBINTMAP=1, use USB_MAPH (73rd) andUSB_MAPL (74th) interrupts.

1.1.4 System Tick (SysTick)

The System Tick is a 24-bit downcounter. It will be reloaded with the initial value automatically when it is decremented to zero. It can generate periodic interrupts, so it is often used as multi-task scheduling counter for embedded operating system, and also to call the periodic tasks for non-embedded system.

The System Tick calibration value is fixed to 9000, which gives a reference time base of 1 ms when the System Tick clock is set to 9 MHz.

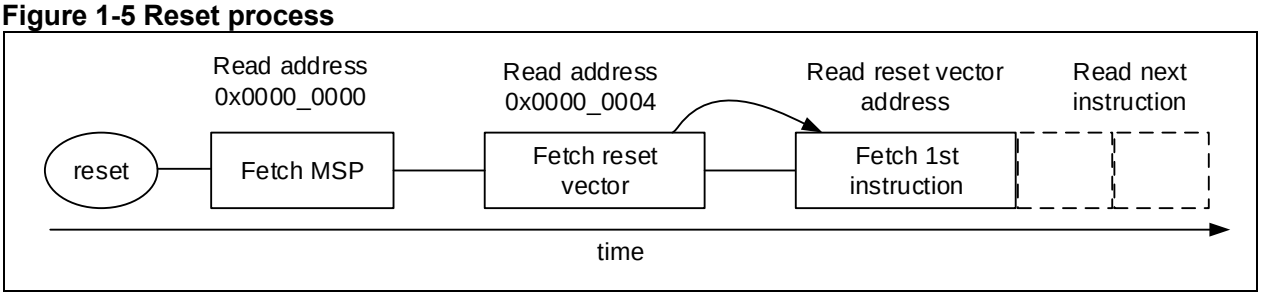
1.1.5 Reset

The processor reads the first two words from the CODE memory after a system reset and before program execution.

- Get the initial value of the main stack pointer (MSP) from address 0x0000_0000
- Get the initial value of the program counter (PC) from address 0x0000_0004. This value

is a reset vector and LSB must be 1. Then take the instructions from the address corresponding to this value.

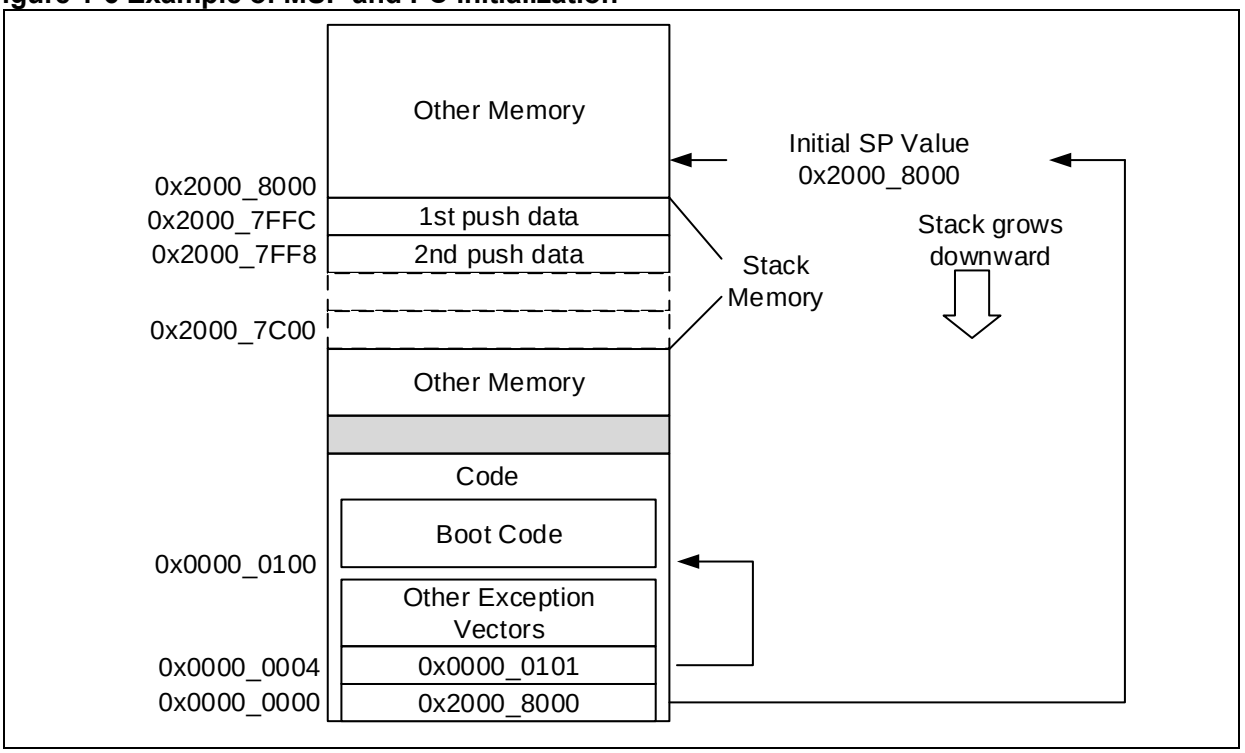
Figure 1-5 Reset process



Cortex®-M4F uses a full stack that increases downward, so the initial value of the main stack pointer (MSP) must be the end address of the stack memory plus 1. For example, if the stack area is set between 0x2000_7C00 and 0x2000_7FFF, then the initial value of MSP must be defined as 0x2000_8000.

The initial value of MSP is followed by the vector table. Cortex®-M4F operates in Thumb state, and thus each data value in the vetor table must set the LSB to 1. In *Figure 1-6*, 0x0000_0101 is used to represent 0x0000_0100. After the instruction at 0x0000_0100 is executed, the program starts running formally. Before that, it is mandatory to initialize MSP, because the first instruction may be interrupted by NMI or other faults before being executed. After the completion of MSP initialization, it is ready to prepare stack room for its service routines.

Figure 1-6 Example of MSP and PC initialization



In the AT32F413 series, the main Flash memory, Boot code or SRAM can be remapped to the code area between 0x0000_0000 and 0x07FF_FFFF. BOOT1 and BOOT0 are used to select the specific memory from which CODE starts.

{BOOT1, BOOT0}=00/10, CODE starts from the main Flash memory

{BOOT1, BOOT0}=01, CODE starts from Boot code

{BOOT1, BOOT0}=11, CODE starts from SRAM

After a system reset or when leaving from Standby mode, the pin values of both BOOT1 and BOOT0 will be relatched.

Boot code memory contains an embedded boot loader program that can be used to reprogram Flash memory through USART1, USART2 or USB interface, and can provide extra firmware including communication protocol stacks that can be called for use by software developer through API.

1.2 List of abbreviations for registers

Table 1-4 List of abbreviations for registers

Register type	Description
rw	Software can read and write to this bit.
ro	Software can only read this bit.
wo	Software can only write to the bit. Reading it returns its reset value.
rrc	Software can read this bit. Reading this bit automaticaly clears it.
rw0c	Software can read this bit and clear it by writing 0. Writing 1 has no effect on this bit.
rw1c	Software can read this bit and clear it by writing 1. Writing 0 has no effect on this bit.
rw1s	Software can read this bit and set it by writing 1. Writing 0 has no effect on this bit.
tog	Software can read this bit and torggle it by writing 1. Writing 0 has no effect on this bit.
rwt	Software can read this bit. Writng any value will trigger an event.
resd	Reserved.

1.3 Device characteristics information

Table 1-5 List of abbreviations for registers

Register abbr.	Base address	Reset value
F_SIZE	0x1FFF F7E0	0xXXXX
UID[31: 0]	0x1FFF F7E8	0xXXXX XXXX
UID[63: 32]	0x1FFF F7EC	0xXXXX XXXX
UID[95: 64]	0x1FFF F7F0	0xXXXX XXXX

1.3.1 Flash memory size register

This register contains the information about Flash memory size.

Bit	Abbr.	Reset value	Type	Descrption
Bit 15: 0	F_SIZE	0xXXXX	ro	Flash size, in terms of KByte For example: 0x0080 = 128 KByte

1.3.2 Device electronic signature

The device electronic signature contains the memory size and the unique device ID (96 bits). It is stored in the information block of the Flash memory. The 96-bit ID is unique for any device, and cannot be altered by users. It can be used for the following:

- Serial number: such as USB string serial number
- Part of security keys

Bit	Abbr.	Reset value	Type	Description
Bit 31: 0	UID[31: 0]	0xXXXX XXXX	ro	UID for bit 31 to bit 0

Bit	Abbr.	Reset value	Type	Description
Bit 31: 0	UID[63: 32]	0xXXXX XXXX	ro	UID for bit 63 to bit 32

Bit	Abbr.	Reset value	Type	Description
Bit 31: 0	UID[95: 64]	0xXXXX XXXX	ro	UID for bit 95 to bit 64

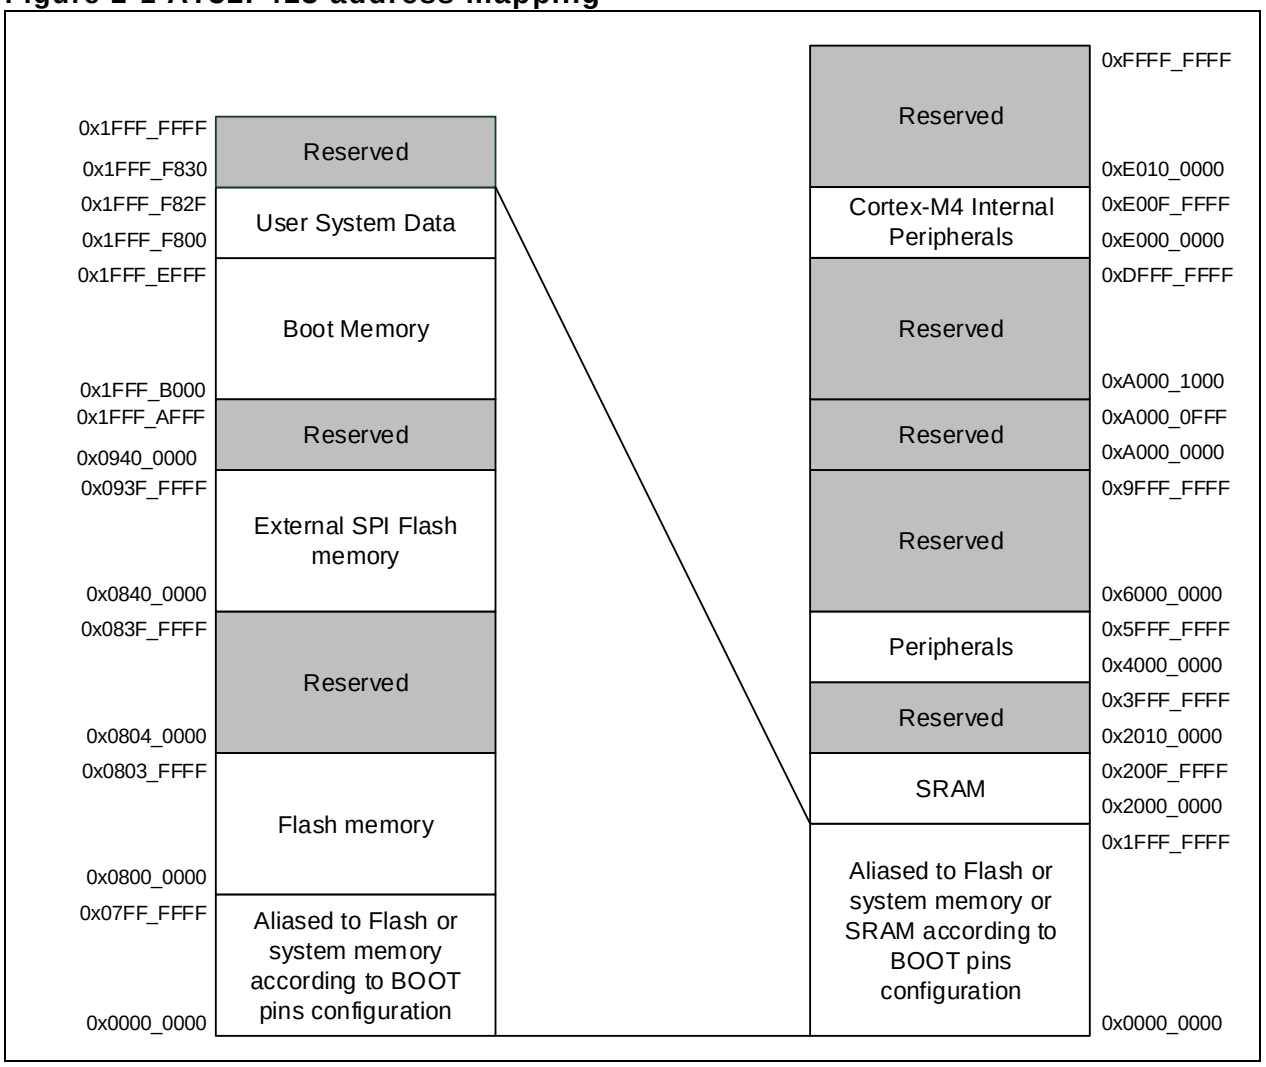
Note: UID[95:88] is series ID, which is 0x04 for AT32F413.

2 Memory resources

2.1 Internal memory address map

Internal memory contains program memory (Flash), data memory (SRAM), peripheral registers and core registers. Their respective address mapping are shown in *Figure 2-1*.

Figure 2-1 AT32F413 address mapping



2.2 Flash memory

AT32F413 series provide up to 256 KB of on-chip Flash memory, supporting a zero wait state single cycle 32-bit read operation.

Refer to *Chapter 5* for more details about Flash memory controller and register configuration.

Flash memory organization (256K)

The main memory contains bank 1 only (256 Kbytes), including 128 sectors, and 2 Kbytes per sector.

External memory size can be up to 16 Mbytes, including 4096 sectors, and 4 Kbytes per sector.

Block		Name	Address range
Main memory	Bank 1 256 KB	Sector 0	0x0800 0000 – 0x0800 07FF
		Sector 1	0x0800 0800 – 0x0800 0FFF
		Sector 2	0x0800 1000 – 0x0800 17FF
		…	…
		Sector 127	0x0803 F800 – 0x0803 FFFF

2.3 SRAM memory

The AT32F413 series contain up to 16 KB of on-chip SRAM which starts at the address 0x2000_0000. It supports byte, half-word (16 bit) and word (32 bit) accesses. In addition, AT32F413 also provide a special mode that supports dynamic switch between 16 KB and 64 KB of SRAM. This is done by setting the EOPB0 bit. In 64 KB mode, Flash memory size (zero wait sate) is limited to 64 KB, while in 16 KB mode, the zero-wait-state Flash size is limited to 112 KB.

	0x4000 0000 - 0x4000 03FF	TMR2 timer

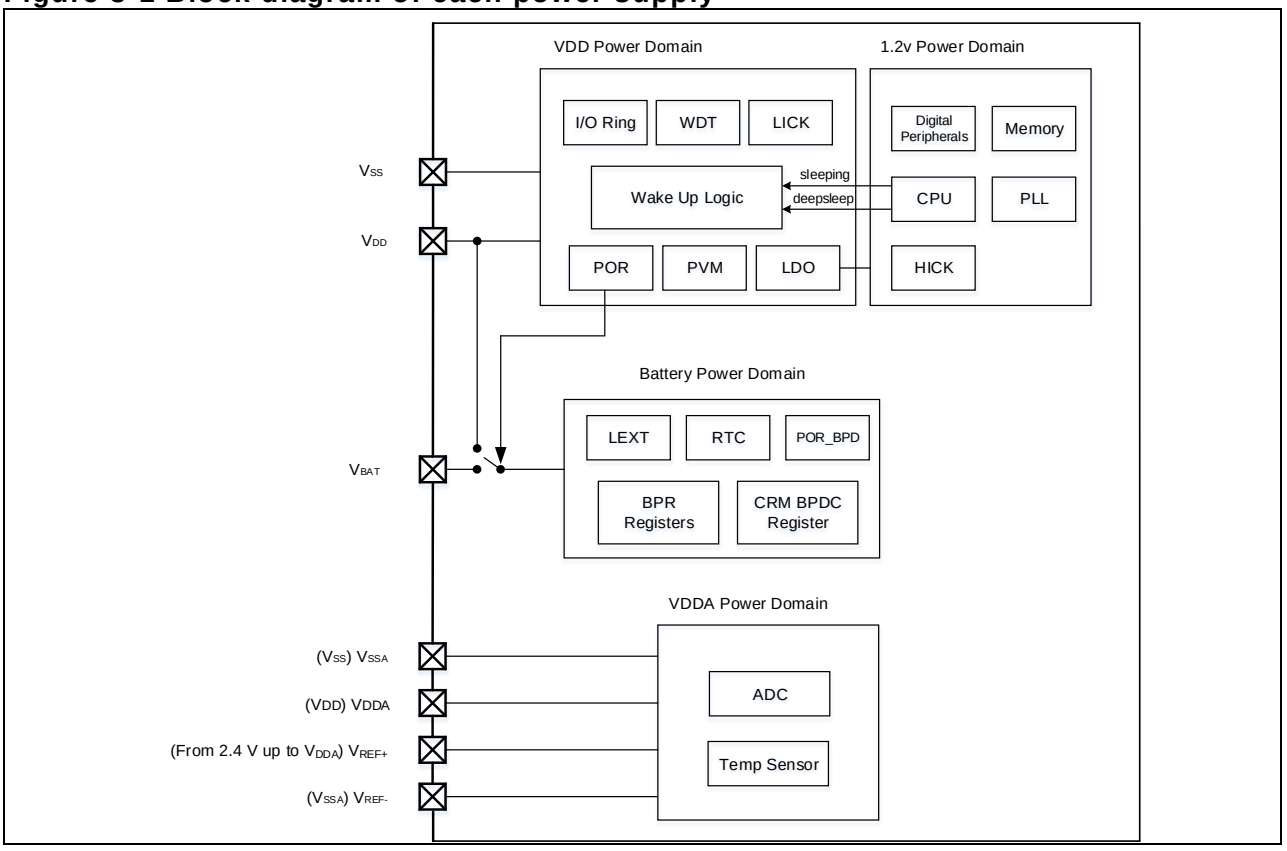
Note: 1.When USBBUFS = 0, USBFS buffer size is 512 bytes, its address is 0x4000 6000 ~ 0x400063FF. When USBBUFS = 1, USBFS buffer size is 768 ~ 1280 bytes, its address is 0x4000 7800 ~ 0x4000 83FF. If both CAN1 and CAN2 are not enabled, the maximum USBFS buffer can be set to 1280 bytes; If any one of them is enabled, the maximum USBFS buffer can be up to 1024 bytes; If both are enabled, the maximum USB buffer can be set to 768 bytes.

3 Power control (PWC)

3.1 Introduction

For AT32F413 series, its operating voltage supply is 2.6 V ~ 3.6 V, with a temperature range of -40~+105 ℃. To reduce power consumption, the device provides three types of power saving modes, including Sleep, Deepsleep and Standby modes so as to achieve the best tradeoff among the conflicting demands of CPU operating time, speed and power consumption.The AT32F413 series have three power domains—VDD/VDDA domain, 1.2 V domain and battery powered domain. The VDD/VDDA domain is supplied directly by external power, the 1.2 V domain is powered by the embedded LDO in the VDD/VDDA domain, and the battery powered domain is supplied through a V_{BAT} pin.

Figure 3-1 Block diagram of each power supply



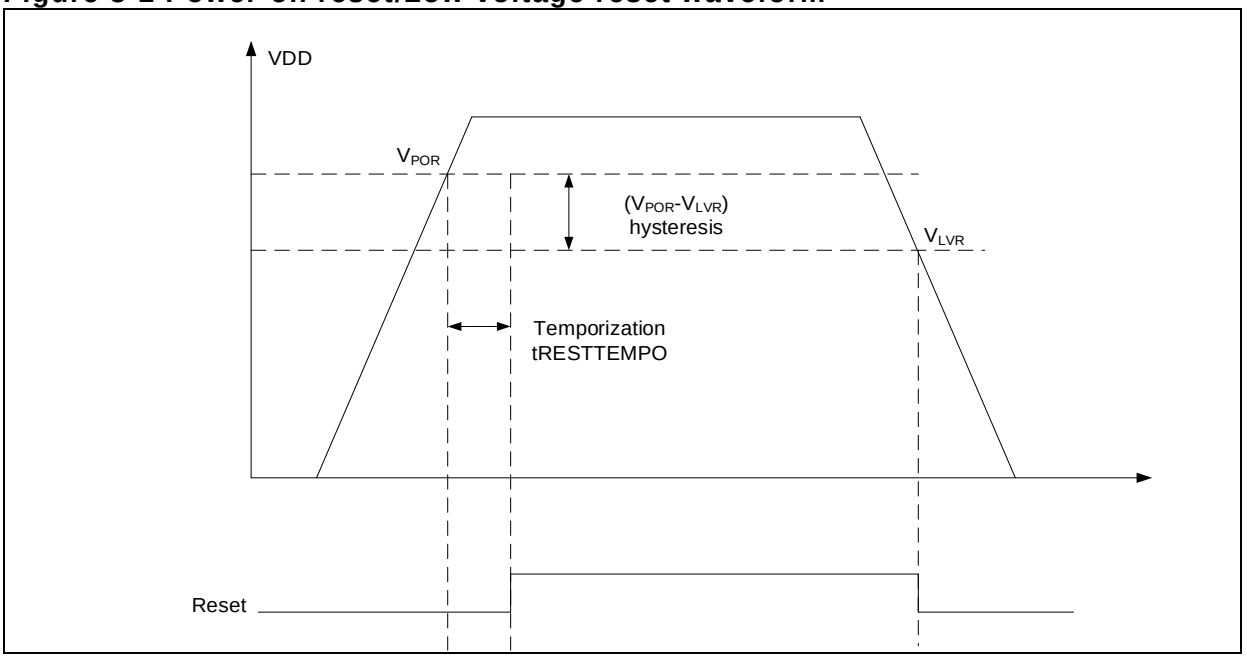
3.2 Main Features

- Three power domains: VDD/VDDA domain, 1.2 V domain and battery powered domain
- Three types of power saving modes: Sleep mode, Deepsleep mode, and Standby mode
- Internal voltage regulator supplies 1.2 V voltage source for the core domain
- Power voltage detector is provided to generate an interrupt when the supply voltage is lower or higher than a programmed threshold
- The battery powered domain is powered by V_{BAT} when VDD is powered off
- VDD/VDDA applies independent digital and analog module to reduce noise on external power

3.3 POR/LVR

A POR analog module embedded in the VDD/VDDA domain is used to generate a power reset. The power reset signal is released at V_{POR} when the VDD is increased from 0 V to the operating voltage, or it is triggered at V_{LVR} when the VDD drops from the operating voltage to 0 V. During the power-on reset period, the reset signal has certain amount of time delay compared to VDD boost process. At the same time, hysteresis occurs in power-on reset (POR) and low voltage reset (LVR).

Figure 3-2 Power-on reset/Low voltage reset waveform

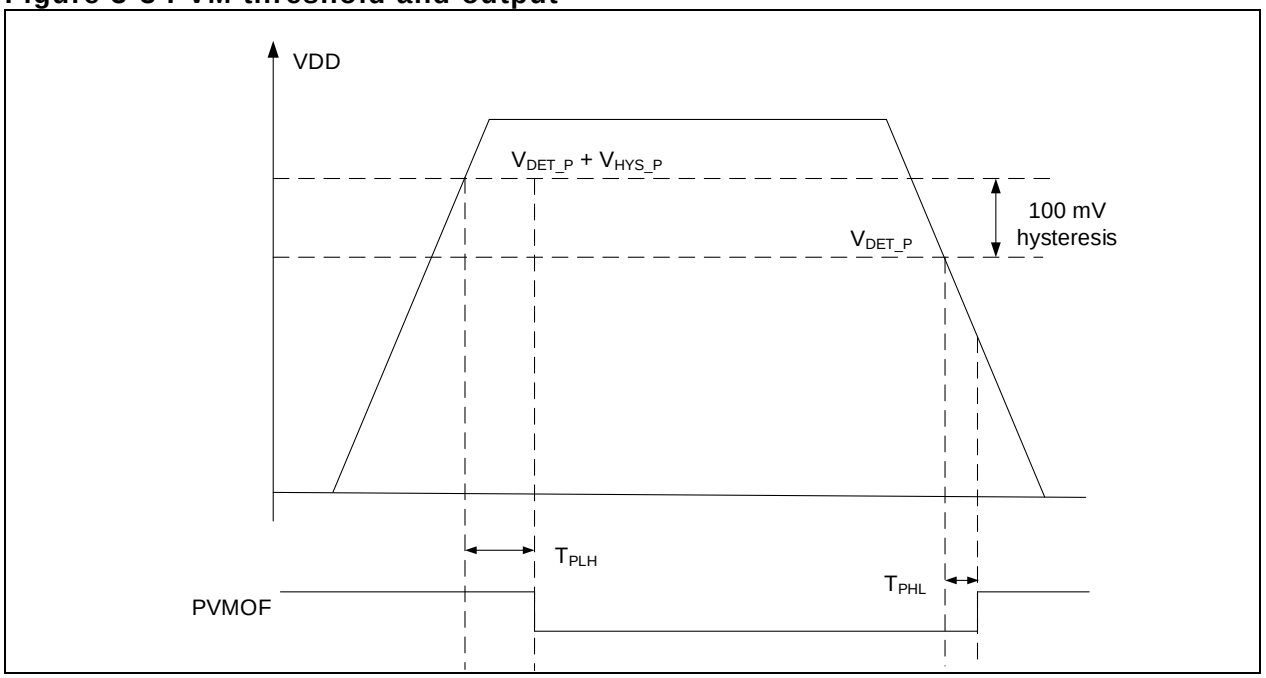


3.4 Power voltage monitor (PVM)

The PVM is used to monitor the power supply variations. It is enabled by setting the PVMEN bit in the power control register (PWC_CTRL), and the threshold value for voltage monitor is selected with the PVMSEL[2: 0].

After PVM is enabled, the comparison result between VDD and the programmed threshold is indicated by the PVMOF bit in the PWC_CTRLSTS register, with the hysteresis voltage VHYS_P being 100 mv. The PVM interrupt will be generated through the EXTI line 16 when VDD rises above the PVM threshold.

Figure 3-3 PVM threshold and output



3.5 Power domain

1.2 V domain

1.2 V core domain includes a CPU core, SRAM, embedded digital peripherals and Phase Locked Loop (PLL). Such power domain is supplied by LDO (voltage regulator).

VDD/VDDA domain

VDD/VDDA domain includes VDD domain and VDDA domain. The VDD domain contains I/O circuit, power-saving mode wakeup circuit, watchdog timer, power-on reset/low voltage reset (POR/LVR), LDO and all PAD circuits other than PC13, PC14 and PC15. The VDDA domain contains DAC/ADC (DA/AD converters), temperature sensor and so on.

Typically, to ensure a better accuracy of ADC/DAC at a low voltage, the digital circuit is supplied by VDD while the analog circuit is powered by VDDA. On 64-pin packages and packages with less pins, the external reference voltage VREF+ and VREF- are connected to the VDDA pin and VSSA pin, respectively.

Battery powered domain

The battery powered domain contains RTC circuit, LEXT oscillator, PC13, PC14 and PC15, which is powered by either VDD or VBAT pin. When the VDD is cut off, the battery powered domain is automatically switched to VBAT pin to ensure that RTC can work normally.

1) When the battery powered domain is powered by VDD, the PC13 can be used as a general-purpose I/O, tamper pin, RTC calibration clock, RTC alarm or second output, while the PC14 and PC15 can be used as a GPIO or LEXT pin. (As an I/O port, PC13, PC14 and PC15 must be limited below 2 MHz, and to the maximum load of 30 pF, and these I/O ports must not be used as current sources)
2) When the battery powered domain is powered by VBAT, the PC13 can be used as a a tamper pin, RTC alarm or second output, while the PC14 and PC15 can only be used as a LEXT pin.

The switch of the battery powered domain will not be disconnected from VBAT because of the VDD being at its rising phrase or due to VDD low voltage reset. If the power switch has not been switched to the VDD when the VDD is powered on quickly, it is recommended to add a low votage drop diode between VDD and VBAT in order to prevent the currents of VDD from being injected to VBAT. If there is no external battery in the application, it is better to connet the VBAT to a 100 nF ceramic filter capacitor that is externally connected to VDD.

3.6 Power saving modes

When the CPU does not need to be kept running, there are three types of low-power modes available (Sleep mode, Deepsleep mode and Standby mode) to save power. Users can select the mode that gives the best compromise according to the low-power consumption, short startup time, and available wakeup sources. In addition, the power consumption in Run mode can be reduced by slowing down the system clocks or gating the clocks on the APB and AHB peripherals when they are not used.

Sleep mode

The Sleep mode is entered by executing WFI or WFE command. There are two options to select the Sleep mode entry mechanism through the SLEEPONEXIT bit in the Cortex ® -M4F system control register.

SLEEP-NOW mode:

When SLEEPDEEP=0 and SLEEPONEXIT=0, the MCU enters Sleep mode as soon as WFI or WFE instruction is executed.

SLEEP-ON-EXIT mode:

When SLEEPDEEP=0 and SLEEPONEXIT=1, the MCU enters Sleep mode as soon as the system exits the lowest-priority interrupt service routine by executing the WFI instruction.

In Sleep mode, all clocks and LDO work normally except CPU clocks (stopped), and all I/O pins keep the same state as in Run mode. The LDO provides an 1.2 V power (for CPU core, memory and embedded peripherals) as it is in normal power consumption mode.

1) If the WFI is executed to enter Sleep mode, any peripheral interrupt can wake up the device from Sleep mode.
2) If the WFE is executed to enter Sleep mode, the MCU exits Sleep mode as soon as an event occurs.

The wakeup event can be generated by the following:

- Enabling a peripheral interrupt (it is not enabled in the NVIC) and enabling the SEVONPEND bit. When the MCU resumes, the peripheral interrupt pending bit and NVIC channel pending bit must be cleared.
- Configuring an internal EXINT line as an event mode to generate a wakeup event.

  The wakeup time required by a WFE command is the shortest, since no time is wasted on interrupt entry/exit.

Deepsleep Mode

Deepsleep mode is entered by setting the SLEEPDEEP bit in the Cortex®-M4F system control register and clearing the LPSEL bit in the power control register before WFI or WFE instructions.

The LDO status is selected by setting the VRSEL bit in the power control register (PWC_CTRL). When VRSEL=0, the LDO works in normal mode. When VRSEL=1, the LDO is set in low-power consumption mode.

In Deepsleep mode, all clocks in 1.2 V domain are stopped, and both HICK and HEXT oscillators are disabled. The LDO supplies power to the 1.2 V domain in normal mode or low-power mode. All I/O pins keep the same state as in Run mode. SRAM and register contents are preserved.

1) When the Sleep mode is entered by executing a WFI instruction, the interrupt generated on any external interrupt line in Interrupt mode can wake up the system from Deepsleep mode.
2) When the Sleep mode is entered by executing a WFE instruction, the interrupt generated on any external interrupt line in Event mode can wake up the system from Deepsleep mode.

When the MCU exits the Deepsleep mode, the HICK RC oscillator is enabled and selected as a system clock after stabilization.When the LDO operates in low-power mode, an additional wakeup delay is incurred for the reason that the LDO must be stabilized before the system is waken from the Deepsleep mode.

Standby Mode

Standby mode can achieve the lowest power consumption for the device. In this mode, the LDO is disabled. The whole 1.2 V domain, PLL, HICK and HEXT oscillators are also powered off. SRAM and register contents are lost. Only registers in the battery powered domain and standby circuitry remain supplied.

The Standby mode is entered by the following procedures:

- Set the SLEEPDEE bit in the Cortex®-M4F system control register
- Set the LPSEL bit in the power control register (PWC_CTRL)
- Clear the SWEF bit in the power control/status register (PWC_CTRLSTS)
- Execute a WFI/WFE instruction

In Standby mode, all I/O pins remain in a high-impedance state except reset pins, TAMPER pins that are set as anti-tamper or calibration output, and the wakeup pins enabled.

The MCU leaves the Standby mode when an external reset (NRST pin), an WDT reset, a rising edge on the WKUP pin or the rising edge of an RTC alarm even occurs.

Debug mode

By default, the debug connection is lost if the MCU enters Deepsleep mode or Standby mode while debugging. The reason is that the Cortex®-M4F core is no longer clocked. However, the software can be debugged even in the low-power mode by setting some configuration bits in the DEBUG register (DEBUG_CTRL).

3.7 PWC registers

The peripheral registers can be accessed by half-words (16 bits) or words (32 bits)

Table 3-1 PW register map and reset values

Register abbr.	Offset	Reset value
PWC_CTRL	0x00	0x0000 0000
PWC_CTRLSTS	0x04	0x0000 0000

3.7.1 Power control register (PWC_CTRL)

Bit	Name	Reset value	Type	Description
Bit 31: 9	Reserved	0x000000	resd	Kept at its default value.
Bit 8	BPWEN	0x0	rw	Battery powered domain write enable 0: Disabled 1: Enabled Note: After reset, the battery powered domain write access is disabled. To write, this bit must be set.
Bit 7: 5	PVMSEL	0x0	rw	Power voltage monitoring boundary select 000: Unused, not configurable 001: 2.3 V 010: 2.4 V 011: 2.5 V 100: 2.6 V 101: 2.7 V 110: 2.8 V 111: 2.9 V
Bit 4	PVMEN	0x0	rw	Power voltage monitoring enable 0: Disabled 1: Enabled
Bit 3	CLSEF	0x0	wo	Clear SEF flag 0: No effect 1: Clear the SEF flag Note: This bit is cleared by hardware after clearing the SEF flag. Reading this bit at any time will return all zero.
Bit 2	CLSWEF	0x0	wo	Clear SWEF flag 0: No effect 1: Clear the SWEF flag Note: Clear the SWEF flag after two system clock cycles. This bit is cleared by hardware after clearing the SWEF flag. Reading this bit at any time will return all zero.
Bit 1	LPSEL	0x0	rw	Low power mode select in sleepdeep 0: Enter DEEPSLEEP mode 1: Enter Standby mode
Bit 0	Reserved	0x0	resd	Kept at its default value.

3.7.2 Power control/status register (PWC_CTRLSTS)

Additional APB cycles are needed to read this register versus a standard APB read.

Bit	Name	Reset value	Type	Description
Bit 31: 9	Reserved	0x000000	resd	Kept at its default value.
Bit 8	SWPEN	0x0	rw	Standby wake-up pin enable 0: Disabled (this pin is used for general-purpose I/O) 1: Enabled (this pin is forced in input pull-down mode, and no longer used for general-purpose I/O) Note: This bit is cleared by hardware after system reset. In Standby mode, this bit is forced to input pull-down mode irrespective of whether this wake-up pin is enabled.
Bit 7: 3	Reserved	0x00	resd	Keep at its default value.
Bit 2	PVMOF	0x0	ro	Power voltage monitoring output flag 0: Power voltage is higher than the threshold 1: Power voltage is lower than the threshold Note: The power voltage monitor is stopped in Standby mode.
Bit 1	SEF	0x0	ro	Standby mode entry flag 0: Device is not in Standby mode 1: Device is in Standby mode Note: This bit is set by hardware (enter Standby mode) and cleared by POR/LVR or by setting the CLSEF bit.
Bit 0	SWEF	0x0	ro	Standby wake-up event flag 0: No wakeup event occurred 1: A wakeup event occurred Note: This bit is set by hardware (on an wakeup event), and cleared by POR/LVR or by setting the CLSWEF bit. A wakeup event is generated by one of the following: When the rising edge on the Standby wakeup pin occurs; When the RTC alarm event occurs; If the Standby wakeup pin is enabled when the Standby wakeup pin level is high.

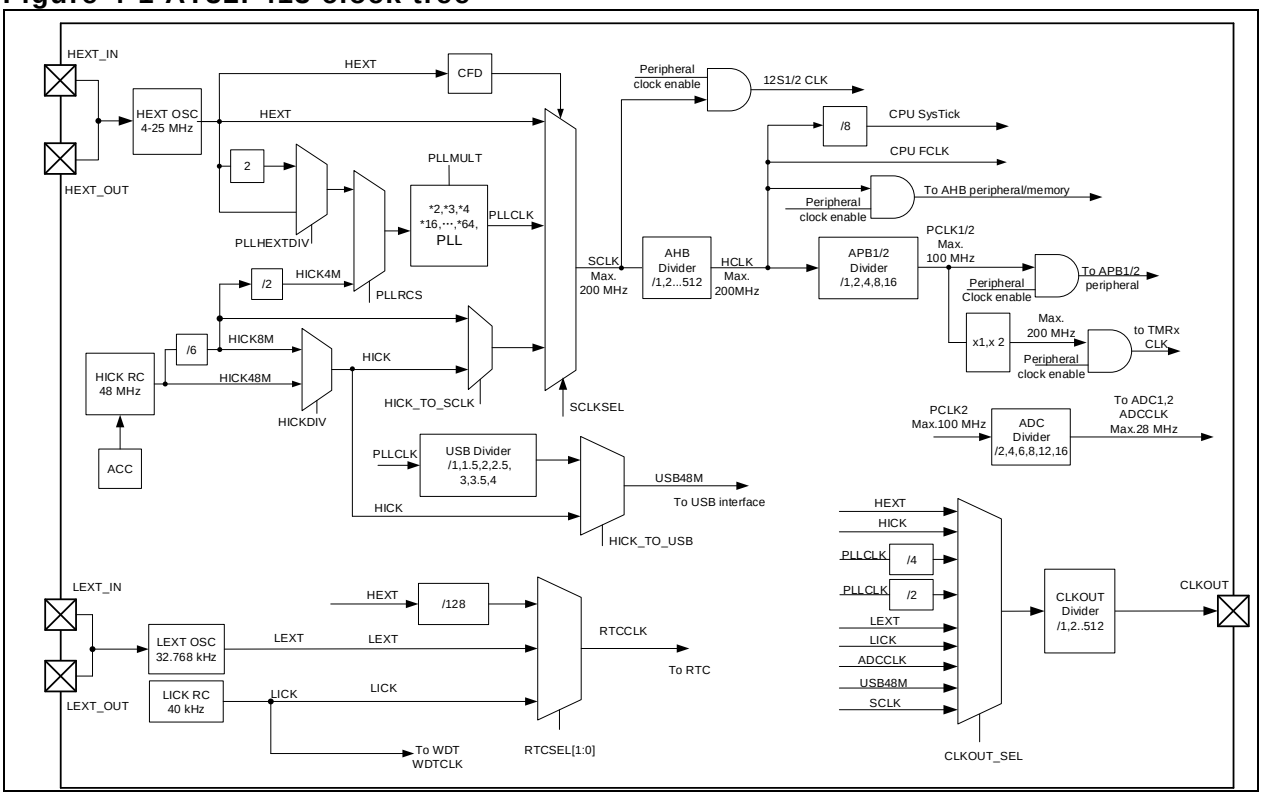
4 Clock and reset management (CRM)

4.1 Clock

AT32F413 series provide different clock sources:

- HEXT (high speed external crystal)
- HICK (high speed internal clock)
- PLL (phased-locked loops)
- LEXT (low speed external crystal)
- LICK (low speed internal clock)

Figure 4-1 AT32F413 clock tree



AHB, APB1 and APB2 all support multiple frequency division. The AHB domain has a maximum of 200 MHz, and both APB1 and APB2 are up to 100 MHz.

4.1.1 Clock sources

- **High speed external oscillator (HEXT)**

The HEXT includes two clock sources: HEXT crystal/ceramic resonator and HEXT bypass clock.

The HEXT crystal/ceramic resonator is connected externally to a 4~25MHz HEXT crystal that produces a highly accurate clock for the system. The HEXT clock signal is not released until it becomes stable.

An external clock source can be provided by HEXT bypass. Its frequency can be up to 25 MHz. The external clock signal should be connected to the HEXT_IN pin while the HEXT_OUT pin should be left floating.

- **High speed internal clock (HICK)**

The HICK oscillator is clocked by a high-speed RC in the microcontroller. The internal frequency of the HICK clock is 48 MHz. Although it is less accurate, its startup time is shorter than the HEXT crystal oscillator. The HICK clock frequency of each device is calibrated by ARTERY for 1% accuracy (25°C) in factory. The factory calibration value is loaded in the HICKCAL[7: 0] bit of the clock control register. The RC oscillator speed may be affected by voltage or temperature variations. Thus the HICK frequency can be trimmed using the HICKTRIM[5: 0] bit in the clock control register.

The HICK clock signal is not released until it becomes stable.

- **PLL clock**

The HICK or HEXT clock can be used as an input clock source of PLL, and the input clock rangs from 2 M to 16 MHz. The input clock source and multiplication factor must be configured before enabling the PLL. Otherwise, once the PLL is enabled, these parameters cannot be changed. The PLL clock signal is not released until it becomes stable.

- **Low speed external oscillator (LEXT)**

The LEXT oscillator provides two clock sources: LEXT crystal/ceramic resonator and LEXT bypass.

LEXT crystal/ceramic resonator:

The LEXT crystal/ceramic resonator provides a 32.768 KHz low-speed clock source. The LEXT clock signal is not released until it becomes stable.

- **LEXT bypass clock**

In this mode, an external clock source with a frequency of 32.768 kHzcan be provided. The external clock signal should be connected to the LEXT_IN pin while the LEXT_OUT remains floating.

- **Low speed internal RC oscillator (LICK)**

The LICK oscillator is clocked by an internal low-speed RC oscillator. The clock frequency is between 30 kHz and 60 kHz. It acts as a low-power clock source that can be kept running in Deepsleep mode and Standby mode for watchdog and auto-wakeup unit.

The LICK clock signal is not released until it becomes stable.

4.1.2 System clock

After a system reset, the HICK oscillator is selected as system clock. The system clock can make flexible switch among HICK oscillator, HEXT oscillator and PLL clock. However, a switch from one clock source to another occurs only if the target clock source becomes stable. When the HICK oscillator is used directly or indirectly through the PLL as the system clock, it cannot be stopped.

4.1.3 Peripheral clock

Most peripherals use HCLK, PCLK1 or PCLK2 clock. The individual peripherals have their dedicated clocks.

System Tick timer (SysTick) is clocked by HCLK or HCLK/8.

ADCs are clocked by APB2 divided by 2, 4, 6, 8, 12 or 16.

The timers are clocked by APB1/2. In particular, if the APB prescaler is 1, the timer clock frequency is equal to that of APB1/2; otherwise, the timer clock frequency is set to double the APB1/2 frequency.

The USB clock source can be switched between HICK and PLL frequency divider. If the HICK is selected as the clock source, the USB clock should be set as 48 MHz; If the PLL frequency divider is selected as the clock source, the USB frequency divider provides 48 MHz USBCLK, and thus the PLL needs to be set as 48*N*0.5 MHz (N=2,3,4,5…)

RTC clock sources: HEXT/128, LEXT oscillator and LICK oscillator. Once the clock source is selected, it cannot be altered without resetting the battery powered domain. If the LEXT is used as RTC clock, the RTC is not affected when the VDD is powered off. If the HEXT or LICK is selected as RTC clock, the RTC state is not guaranteed when both HEXT and LICK are powered off.

Watchdog is clocked by LICK oscillator. If the watchdog is enabled by either hardware option or software access, the LICK oscillator is forced ON. The clock is provided to the watchdog only after the LICK oscillator temporization.

4.1.4 Clock fail detector

The clock fail detector (CFD) is designed to respond to HEXT clock failure when the HEXT is used as the system clock ,directly or indirectly. If a failure is detected on the HEXT clock, a clock failure event is sent to the break input of TMR1 and TMR8 and an interrupt is generated. This interrrpt is directly linked to CPU NMI so that the software can perform rescue operations. The NMI interrupt keeps executing until the CFD interrupt pending bit is cleared. This is why the CFD interrupt has to be cleared in the NMI service rounte. The HEXT clock failure will result in a switch of the system clock to the HICK clock, the CFD to be disabled , HEXT clock to be stopped, and even PLL to be disabled if the HEXT clock is selected as the system clock through PLL.

4.1.5 Auto step-by-step system clock switch

The automatic frequency switch is designed to ensure a smooth and stable switch of system frequency when the system clock source is switched from others to the PLL or when the AHB prescaler is changed from large to small. When the operational target is larger than 108 MHz, it is recommended to enable the automatic frequency switch. Once it is enabled, the AHB bus is halted by hardware till the completion of the switch. During this switch period, the DMA remain working, and the interrupt events are recorded and then handled by NVIC when the AHB bus resumes.

4.1.6 Internal clock output

The microcontroller allows the internal clock signal to be output to an external CLKOUT pin. That is, ADC CLK, USB48M, SCLK, LICK, LEXT, HICK, HEXT, PLL/2 and PLL/4 can be output to the CLKOUT pin.

4.1.7 Interrupts

The microcontroller specifies a stable flag for each clock source. As a result, when a clock source is enabled, it is possible to determine if the clock is stable by checking the flag pertaining to the clock source. An interrupt request is generated when the interrupt corresponding to the clock source is enabled.

If a failure is detected on the HEXT clock, the CFD interrupt is generated. Such interrrpt is directly linked to CPU NMI.

4.2 Reset

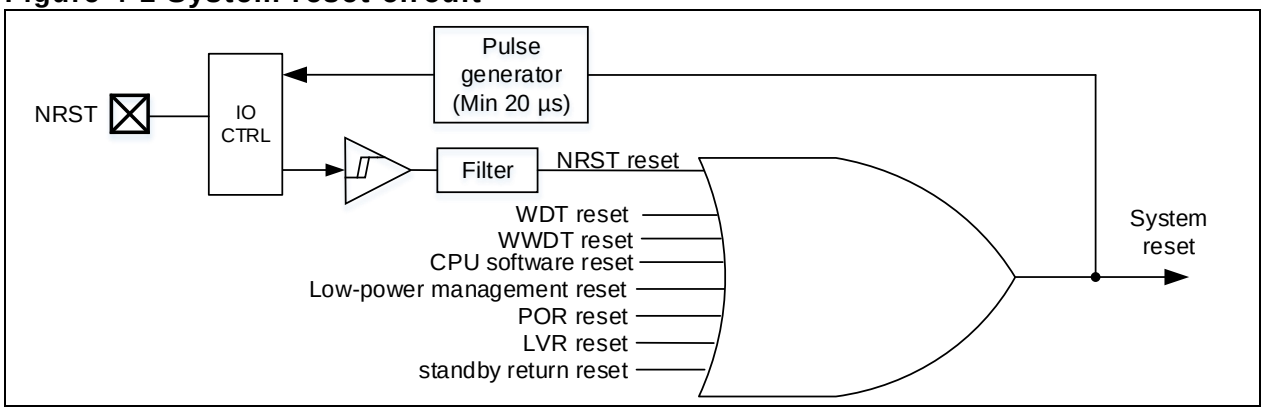
4.2.1 System reset

AT32F413 series provide the following system reset sources:

- NRST reset: on the external NRST pin
- WDT reset: watchdog overflow
- WWDT reset: window watchdog overflow
- CPU software reset: Cortex®-M4F software reset
- Low-power management reset: this type of reset is enabled when entering Standby mode (by clearing the nSTDBY_RST bit in the user system data); this type of reset is enabled when entering Deepsleep mode (by clearing the nDEPSLP_RST in the user system data).
- POR reset: power-on reset
- LVR reset: low voltage reset
- When exiting Standby mode

NRST reset, WDT reset, WWDT reset, software reset and low-power management reset sets all registers to their reset values except the clock control/status register (CRM_CTRLSTS) and the battery powered domain; the power-on reset, low-voltage reset or reset generated when exiting Standby mode sets all registers to their reset values except the battery powered domain registers.

Figure 4-2 System reset circuit



4.2.2 Battery powered domain reset

Battery powered domain has two specific reset sources:

- Software reset: triggered by setting the BPDRST bit in the battery powered domain control register (CRM_BPDC)
- VDD or VBAT power on, if both supplies have been powered off.

Software reset affects only the battery powered domain.

4.3 CRM registers

These peripheral registers have to be accessed by bytes (8 bits), half words (16 bits) or words (32 bits).

Table 4-1 CRM register map and reset values

Register	Offset	Reset value
CRM_CTRL	0x000	0x0000 XX83
CRM_CFG	0x004	0x0000 0000
CRM_CLKINT	0x008	0x0000 0000
CRM_APB2RST	0x00C	0x0000 0000
CRM_APB1RST	0x010	0x0000 0000
CRM_AHBEN	0x014	0x0000 0014
CRM_APB2EN	0x018	0x0000 0000
CRM_APB1EN	0x01C	0x0000 0000
CRM_BPDC	0x020	0x0000 0000
CRM_CTRLSTS	0x024	0x0C00 0000
CRM_MISC1	0x030	0x0000 0000
CRM_MISC2	0x050	0x0000 0000
CRM_MISC3	0x054	0x0000 000D
CRM_INTMAP	0x05C	0x0000 0000

4.3.1 Clock control register (CRM_CTRL)

Accessible: no wait state, word, half-word and byte.

Bit	Name	Reset value	Type	Description
Bit 30: 26	Reserved	0x00	resd	Kept at its default value.
Bit 25	PLLSTBL	0x0	ro	PLL clock stable This bit is set by hardware after PLL is ready. 0: PLL clock is not ready. 1: PLL clock is ready.
Bit 24	PLLEN	0x0	rw	PLL enable This bit is set and cleared by software. It can also be cleared by hardware when entering Standby or Deepsleep mode. When the PLL clock is used as the system clock, this bit cannot be cleared. 0: PLL is OFF 1: PLL is ON.
Bit 23: 20	Reserved	0x0	resd	Kept at its default value.
Bit 19	CFDEN	0x0	rw	Clock failure detector enable 0: OFF 1: ON
Bit 18	HEXTBYPS	0x0	rw	High speed external crystal bypass This bit can be written only if the HEXT is disabled. 0: OFF 1: ON
Bit 17	HEXTSTBL	0x0	ro	High speed external crystal stable This bit is set by hardware after HEXT becomes stable. 0: HEXT is not ready. 1: HEXT is ready.
Bit 16	HEXTEN	0x0	rw	High speed external crystal enable This bit is set and cleared by software. It can also be cleared by hardware when entering Standby or Deepsleep mode. When the HEXT clock is used as the system clock, this bit cannot be cleared 0: OFF. 1: ON
Bit 15: 8	HICKCAL	0xXX	rw	High speed internal clock calibration The default value of this field is the initial factory calibration value. When the HICK output frequency is 48 MHz, it needs adjust 240 kHz (design value) based on this frequency for each HICKCAL value change; when HICK output frequency is 8 MHz (design value), it needs adjust 40 kHz based on this frequency for each HICKCAL value change. Note: This bit can be written only if the HICKCAL_KEY[7: 0] is set as 0x5A.
Bit 7: 2	HICKTRIM	0x20	rw	High speed internal clock trimming These bits work with the HICKCAL[7: 0] to determine the HICK oscillator frequency. The default value is 32, which can trim the HICK to be ±1%.
Bit 1	HICKSTBL	0x1	ro	High speed internal clock stable This bit is set by hardware after the HICK is ready. 0: Not ready 1: Ready
Bit 0	HICKEN	0x1	rw	High speed internal clock enable This bit is set and cleared by software. It can also be set by hardware when exiting Standby or Deepsleep mode. When

				a HEXT clock failure occurs. This bit can also be set. When the HICK is used as the sytem clock, this bit cannot be cleared. 0: Disabled 1: Enabled

4.3.2 Clock configuration register (CRM_CFG)

Accessible: 0 to 2 wait states, word, half-word and byte. 1 or 2 wait states are inserted only when the access occurs during a clock source switch.

Bit	Name	Reset value	Type	Description
Bit 31	PLLRANGE	0x0	rw	PLL clock output range 0: PLL output ≦ 72 MHz 1: PLL output > 72 MHz
Bit 26: 24	CLKOUT_SEL	0x0	rw	Clock output selection CLKOUT_SEL[3] is in bit 16 of the CRM_MISC1 register. 0000: Not clock output 0001: Reserved 0010: LICK 0011: LEXT 0100: SCLK 0101: HICK 0110: HEXT 0111: PLL/2 1100: PLL/4 1101: USB 1110: ADC
Bit 27 Bit 23: 22	USBDIV	0x0	rw	USB frequency division factor After being divided, the PLL clock is used as USB clock. 000: PLL clock divided by 1.5 to be USB clock 001: PLL clock is directly to be USB clock. 010: PLL clock divided by 2.5 to be USB clock 011: PLL clock divided by 2 to be USB clock 100: PLL clock divided by 3.5 to be USB clock 101: PLL clock divided by 3 to be USB clock 110: PLL clock divided by 4 to be USB clock 111: PLL clock divided by 4 to be USB clock
Bit 30: 29 Bit 21: 18	PLLMULT	0x00	rw	PLL multiplication factor { Bit 30: 29, Bit 21: 18} 000000: PLL output x 2 000001: PLL output x 3 000010: PLL output x 4 000011: PLL output x 5 …… 001100: PLL output x 14 001101: PLL output x 15 001110: PLL output x 16 001111: PLL output x 16 010000: PLL output x 17 010001: PLL output x 18 010010: PLL output x 19 010011: PLL output x 20 …… 111110: PLL output x 63 111111: PLL output x 64 Note: PLLRANGE bit has to be configured along with PLL output.
Bit 17	PLLHEXTDIV	0x0	rw	HEXT division selection for PLL entry clock 0: HEXT is not divided 1: HEXT is divided according to the setting of HEXTDIV.
Bit 16	PLLRCS	0x0	rw	PLL entry clock select 0: HICK clock divided (4MHz) to be PLL entry clock

				1: HEXT clock is used as PLL entry clock
Bit 28 Bit 15: 14	ADCDIV	0x0	rw	ADC division PCLK division is used as ADC clock. 000: PCLK divided by 2 to be ADC clock 001: PCLK divided by 4 to be ADC clock 010: PCLK divided by 6 to be ADC clock 011: PCLK divided by 8 to be ADC clock 100: PCLK divided by 2 to be ADC clock 101: PCLK divided by 12 to be ADC clock 110: PCLK divided by 8 to be ADC clock 111: PCLK divided by 16 to be ADC clock
Bit 13: 11	APB2DIV	0x0	rw	APB2 division HCLK frequency division is used as APB2 clock. 0xx: HCLK is not divided 100: HCLK is divided by 2 101: HCLK is divided by 4 110: HCLK is divided by 8 111: HCLK is divided by 16 Note: These bit must be configured by software to ensure that the APB2 clock frequency is less than 100 MHz.
Bit 10: 8	APB1DIV	0x0	rw	APB1 division HCLK frequency division is used as APB1 clock. 0xx: HCLK is not divided 100: HCLK is divided by 2 101: HCLK is divided by 4 110: HCLK is divided by 8 111: HCLK is divided by 16 Note: These bit must be configured by software to ensure that the APB1 clock frequency is less than 100 MHz.
Bit 7: 4	AHBDIV	0x0	rw	AHB division The divided SCLK is used as AHB clock. 0xxx: SCLK is not divided 1000: SCLK is divided by 2 1001: SCLK is divided by 4 1010: SCLK is divided by 8 1011: SCLK is divided by 16 1100: SCLK is divided by 64 1101: SCLK is divided by 128 1110: SCLK is divided by 256 1111: SCLK is divided by 512 Note: Prefetch buffer must be enabled when the AHB prescaler factor is greater than 1.
Bit 3: 2	SCLKSTS	0x0	ro	System clock select status 00: HICK 01: HEXT 10: PLL 11: Reserved, default value.
Bit 1: 0	SCLKSEL	0x0	rw	System clock select 00: HICK 01: HEXT 10: PLL 11: Reserved, default value.

4.3.3 Clock interrupt register (CRM_CLKINT)

Accessible: no-wait state, word, half-word and byte.

Bit	Name	Reset value	Type	Description
Bit 31: 24	Reserved	0x00	resd	Kept at its default value.
Bit 23	CFDFC	0x0	wo	Clock failure detection flag clear Writing 1 by software to clear CFDF. 0: No effect 1: Clear
Bit 22: 21	Reserved	0x0	resd	Kept at its default value.
Bit 20	PLLSTBLFC	0x0	wo	PLL stable flag clear Writing 1 by software to clear PLLSTBLF. 0: No effect 1: Clear
Bit 19	HEXTSTBLFC	0x0	wo	HEXT stable flag clear Writing 1 by software to clear HEXTSTBLF. 0: No effect 1: Clear
Bit 18	HICKSTBLFC	0x0	wo	HICK stable flag clear Writing 1 by software to clear HICKSTBLF. 0: No effect 1: Clear
Bit 17	LEXTSTBLFC	0x0	wo	LEXT stable flag clear Writing 1 by software to clear LEXTSTBLF. 0: No effect 1: Clear
Bit 16	LICKSTBLFC	0x0	wo	LICK stable flag clear Writing 1 by software to clear LICKSTBLF. 0: No effect 1: Clear
Bit 15: 13	Reserved	0x0	resd	Kept at its default value.
Bit 12	PLLSTBLIEN	0x0	rw	PLL stable interrupt enable 0: Disabled 1: Enabled
Bit 11	HEXTSTBLIEN	0x0	rw	HEXT stable interrupt enable 0: Disabled 1: Enabled
Bit 10	HICKSTBLIEN	0x0	rw	HICK stable interrupt enable 0: Disabled 1: Enabled
Bit 9	LEXTSTBLIEN	0x0	rw	LEXT stable interrupt enable 0: Disabled 1: Enabled
Bit 8	LICKSTBLIEN	0x0	rw	LICK stable interrupt enable 0: Disabled 1: Enabled
Bit 7	CFDF	0x0	ro	Clock Failure Detection flag This bit is set by hardware when the HEXT clock failure occurs. 0: No clock failure 1: Clock failure
Bit 6: 5	Reserved	0x0	resd	Kept at its default value.
Bit 4	PLLSTBLF	0x0	ro	PLL stable flag Set by hardware.

				0: PLL is not ready. 1: PLL is ready.
Bit 3	HEXTSTBLF	0x0	ro	HEXT stable flag Set by hardware. 0: HEXT is not ready. 1: HEXT is ready.
Bit 2	HICKSTBLF	0x0	ro	HICK stable flag Set by hardware. 0: HICK is not ready. 1: HICK is ready.
Bit 1	LEXTSTBLF	0x0	ro	LEXT stable flag Set by hardware. 0: LEXT is not ready. 1: LEXT is ready.
Bit 0	LICKSTBLF	0x0	ro	LICK stable interrupt flag Set by hardware. 0: LICK is not ready. 1: LICK is ready.

4.3.4 APB2 peripheral reset register (CRM_APB2RST)

Accessible: no-wait state, word, half-word and byte.

Bit	Name	Reset value	Type	Description
Bit 31: 23	Reserved	0x000	resd	Kept at its default value.
Bit 22	ACCRST	0x0	rw	ACC reset 0: No effect 1: Reset
Bit 21	TMR11RST	0x0	rw	TMR11 reset 0: No effect 1: Reset
Bit 20	TMR10RST	0x0	rw	TMR10 reset 0: No effect 1: Reset
Bit 19	TMR9RST	0x0	rw	TMR9 reset 0: No effect 1: Reset
Bit 18:15	Reserved	0x0	resd	Kept at its default value.
Bit 14	USART1RST	0x0	rw	USART1 reset 0: No effect 1: Reset
Bit 13	TMR8RST	0x0	rw	TMR8 reset 0: No effect 1: Reset
Bit 12	SPI1RST	0x0	rw	SPI1 reset 0: No effect 1: Reset
Bit 11	TMR1RST	0x0	rw	TMR1 reset 0: No effect 1: Reset
Bit 10	ADC2RST	0x0	rw	ADC2 reset 0: No effect 1: Reset
Bit 9	ADC1RST	0x0	rw	ADC1 reset 0: No effect

				1: Reset
Bit 8	Reserved	0x0	resd	Kept at its default value.
Bit 7	GPIOFRST	0x0	rw	GPIOF reset 0: No effect 1: Reset
Bit 6	Reserved	0x0	resd	Kept at its default value.
Bit 5	GPIODRST	0x0	rw	GPIOD reset 0: No effect 1: Reset
Bit 4	GPIOCRST	0x0	rw	GPIOC reset 0: No effect 1: Reset
Bit 3	GPIOBRST	0x0	rw	GPIOB reset 0: No effect 1: Reset
Bit 2	GPIOARST	0x0	rw	GPIOA reset 0: No effect 1: Reset
Bit 1	Reserved	0x0	resd	Kept at its default value.
Bit 0	IOMUXRST	0x0	rw	IOMUX reset 0: No effect 1: Reset

4.3.5 APB1 peripheral reset register (CRM_APB1RST)

Accessible: no-wait state, word, half-word and byte.

Bit	Name	Reset value	Type	Description
Bit 31	CAN2RST	0x0	rw	CAN2 reset 0: No effect 1: Reset
Bit 30: 29	Reserved	0x0	resd	Kept at its default value.
Bit 28	PWCRST	0x0	rw	PWC reset 0: No effect 1: Reset
Bit 27	BPRRST	0x0	rw	Battery powered register reset 0: No effect 1: Reset
Bit 26	Reserved	0x0	resd	Kept at its default value.
Bit 25	CANRST	0x0	rw	CAN1 reset 0: No effect 1: Reset
Bit 24	Reserved	0x0	resd	Kept at its default value.
Bit 23	USBRST	0x0	rw	USB reset 0: No effect 1: Reset
Bit 22	I2C2RST	0x0	rw	I2C2 reset 0: No effect 1: Reset
Bit 21	I2C1RST	0x0	rw	I2C1 reset 0: No effect 1: Reset
Bit 20	UART5RST	0x0	rw	UART5 reset 0: No effect 1: Reset

Bit 19	UART4RST	0x0	rw	UART4 reset 0: No effect 1: Reset
Bit 18	USART3RST	0x0	rw	USART3 reset 0: No effect 1: Reset
Bit 17	USART2RST	0x0	rw	USART2 reset 0: No effect 1: Reset
Bit 16: 15	Reserved	0x0	resd	Kept at its default value.
Bit 14	SPI2RST	0x0	rw	SPI2 reset 0: No effect 1: Reset
Bit 13: 12	Reserved	0x0	resd	Kept at its default value.
Bit 11	WWDTRST	0x0	rw	WWDT reset 0: No effect 1: Reset
Bit 10: 4	Reserved	0x0	resd	Kept at its default value.
Bit 3	TMR5RST	0x0	rw	TMR5 reset 0: No effect 1: Reset
Bit 2	TMR4RST	0x0	rw	TMR4 reset 0: No effect 1: Reset
Bit 1	TMR3RST	0x0	rw	TMR3 reset 0: No effect 1: Reset
Bit 0	TMR2RST	0x0	rw	TMR2 reset 0: No effect 1: Reset

4.3.6 APB peripheral clock enable register (CRM_AHBEN)

Accessible: no-wait state, word, half-word and byte.

Note: When a peripheral clock is disabled, reading this register by software always returns 0x0.

Bit	Name	Reset value	Type	Description
Bit 31: 11	Reserved	0x000000	resd	Kept at its default value.
Bit 10	SDIO1EN	0x0	rw	SDIO1 clock enable 0: Disabled 1: Enabled
Bit 9: 7	Reserved	0x0	rw	Kept at its default value.
Bit 6	CRCEN	0x0	rw	CRC clock enable 0: Disabled 1: Enabled
Bit 5	Reserved	0x0	resd	Kept at its default value.
Bit 4	FLASHEN	0x1	rw	Flash clock enable This bit is used to enable Flash clock in Sleep or Deepsleep mode. 0: Disabled 1: Enabled
Bit 3	Reserved	0x0	resd	Kept at its default value.
Bit 2	SRAMEN	0x1	rw	SRAM clock enable This bit is used to enable SRAM clock in Sleep or Deepsleep mode.

				0: Disabled 1: Enabled
Bit 1	DMA2EN	0x0	rw	DMA2 clock enable 0: Disabled 1: Enabled
Bit 0	DMA1EN	0x0	rw	DMA1 clock enable 0: Disabled 1: Enabled

4.3.7 APB2 peripheral clock enable register (CRM_AHB2EN)

Accessible: no-wait state in most cases, word, half-word and byte.

When accessing to peripherals on APB2 bus, wait states are inserted until the completion of the peripheral access on APB2.

Note: When a peripheral clock is disabled, reading this register by software always returns 0x0.

Bit	Name	Reset value	Type	Description
Bit 31: 23	Reserved	0x000	resd	Kept at its default value.
Bit 22	ACCEN	0x0	rw	ACC clock enable 0: Disabled 1: Enabled
Bit 21	TMR11EN	0x0	rw	TMR11 clock enable 0: Disabled 1: Enabled
Bit 20	TMR10EN	0x0	rw	TMR10 clock enable 0: Disabled 1: Enabled
Bit 19	TMR9EN	0x0	rw	TMR9 clock enable 0: Disabled 1: Enabled
Bit 18: 15	Reserved	0x0	resd	Kept at its default value.
Bit 14	USART1EN	0x0	rw	USART1 clock enable 0: Disabled 1: Enabled
Bit 13	TMR8EN	0x0	rw	TMR8 clock enable 0: Disabled 1: Enabled
Bit 12	SPI1EN	0x0	rw	SPI1 clock enable 0: Disabled 1: Enabled
Bit 11	TMR1EN	0x0	rw	TMR1 clock enable 0: Disabled 1: Enabled
Bit 10	ADC2EN	0x0	rw	ADC2 clock enable 0: Disabled 1: Enabled
Bit 9	ADC1EN	0x0	rw	ADC 1 clock enable 0: Disabled 1: Enabled
Bit 8	Reserved	0x0	rw	Kept at its default value.
Bit 7	GPIOFEN	0x0	rw	GPIOF clock enable 0: Disabled 1: Enabled

Bit 6	GPIOEEN	0x0	rw	GPIOE clock enable 0: Disabled 1: Enabled
Bit 5	GPIODEN	0x0	rw	GPIOD clock enable 0: Disabled 1: Enabled
Bit 4	GPIOCEN	0x0	rw	GPIOC clock enable 0: Disabled 1: Enabled
Bit 3	GPIOBEN	0x0	rw	GPIOB clock enable 0: Disabled 1: Enabled
Bit 2	GPIOAEN	0x0	rw	GPIOA clock enable 0: Disabled 1: Enabled
Bit 1	Reserved	0x0	rw	Keep at its default value.
Bit 0	IOMUXEN	0x0	rw	IOMUX clock enable 0: Disabled 1: Enabled

4.3.8 APB1 peripheral clock enable register (CRM_AHB1EN)

Accessible: no-wait state in most cases, word, half-word and byte.

When accessing to peripherals on APB2 bus, wait states are inserted until the completion of the peripheral access on APB2.

Note: When a peripheral clock is disabled, reading this register by software always returns 0x0.

Bit	Name	Reset value	Type	Description
Bit 31	CAN2EN	0x0	rw	CAN2 clock enable 0: Disabled 1: Enabled
Bit 30: 29	Reserved	0x0	resd	Kept at its default value.
Bit 28	PWCEN	0x0	rw	Power control clock enable 0: Disabled 1: Enabled
Bit 27	BPREN	0x0	rw	BPR clock enable 0: Disabled 1: Enabled
Bit 26	Reserved	0x0	resd	Kept at its default value.
Bit 25	CAN1EN	0x0	rw	CAN1 clock enable 0: Disabled 1: Enabled
Bit 24	Reserved	0x0	resd	Kept its default value.
Bit 23	USBEN	0x0	rw	USB clock enable 0: Disabled 1: Enabled
Bit 22	I2C2EN	0x0	rw	I2C2 clock enable 0: Disabled 1: Enabled
Bit 21	I2C1EN	0x0	rw	I2C1 clock enable 0: Disabled 1: Enabled
Bit 20	UART5EN	0x0	rw	UART5 clock enable 0: Disabled 1: Enabled
Bit 19	UART4EN	0x0	rw	UART4 clock enable

				0: Disabled 1: Enabled
Bit 18	USART3EN	0x0	rw	USART3 clock enable 0: Disabled 1: Enabled
Bit 17	USART2EN	0x0	rw	USART2 clock enable 0: Disabled 1: Enabled
Bit 16: 15	Reserved	0x0	resd	Kept at its default value.
Bit 14	SPI2EN	0x0	rw	SPI2 clock enable 0: Disabled 1: Enabled
Bit 13: 12	Reserved	0x0	resd	Kept at its default value.
Bit 11	WWDTEN	0x0	rw	WWDT clock enable 0: Disabled 1: Enabled
Bit 10: 4	Reserved	0x0	resd	Kept its default value.
Bit 3	TMR5EN	0x0	rw	TMR5 clock enable 0: Disabled 1: Enabled
Bit 2	TMR4EN	0x0	rw	TMR4 clock enable 0: Disabled 1: Enabled
Bit 1	TMR3EN	0x0	rw	TMR3 clock enable 0: Disabled 1: Enabled
Bit 0	TMR2EN	0x0	rw	TMR2 clock enable 0: Disabled 1: Enabled

4.3.9 Battery powered domain control register (CRM_BPDC)

Access: 0 to 3 wait states. Wait states are inserted in the case of consecutive accesses to this register.

Note: LEXTEN, LEXTBYPS, RTCSEL, and RTCEN bits of the battery powered domain control register (CRM_BDC) are in the battery powered domain. As a result, these bits are write protected after reset, and can only be modified by setting the BPWEN bit in the power control register (PWR_CTRL). These bits could be reset only by battery powered domain reset. Any internal or external Reset does not affect these bits.

Bit	Name	Reset value	Type	Description
Bit 31: 17	Reserved	0x0000	resd	Kept at its default value.
Bit 16	BPDRST	0x0	rw	Battery powered domain software reset 0: No effect 1: Reset
Bit 15	RTCEN	0x0	rw	RTC clock enable Set and cleared by software. 0: Disabled 1: Enabled
Bit 14: 10	Reserved	0x00	resd	Kept at its default value.
Bit 9: 8	RTCSEL	0x0	rw	RTC clock selection Once the RTC clock source is selected, it cannot be changed until the BPDRST bit is reset. 00: No clock 01: LEXT

				10: LICK 11: HEXT/128
Bit 7: 3	Reserved	0x00	resd	Kept at its default value.
Bit 2	LEXTBYPS	0x0	rw	Low speed external crystal bypass 0: Disabled 1: Enabled
Bit 1	LEXTSTBL	0x0	ro	Low speed external oscillator stable Set by hardware after the LEXT is ready. 0: LEXT is not ready. 1: LEXT is ready.
Bit 0	LEXTEN	0x0	rw	External low-speed oscillator enable 0: Disabled 1: Enabled

4.3.10 Control/status register (CRM_CTRLSTS)

Reset flag can only be cleared by a system reset, while others are cleared by a power reset or writing RSTFC bit.

Accessible: 0 to 3 wait states, word, half-word and byte. Wait states are inserted in the case of consecutive accesses to this register.

Bit	Name	Reset value	Type	Description
Bit 31	LPRSTF	0x0	ro	Low-power reset flag Sety by hardware. Cleared by writing to the RSTFC bit. 0: No low-power reset occurs 1: Low-power reset occurs
Bit 30	WWDTRSTF	0x0	ro	Window watchdogtimer reset flag Sety by hardware. Cleared by writing to the RSTFC bit. 0: No window watchdogtimer reset occurs 1: Window watchdogtimer reset occurs
Bit 29	WDTRSTF	0x0	ro	Watchdog timer reset flag Sety by hardware. Cleared by writing to the RSTFC bit. 0: No watchdog timer reset occurs 1: Watchdog timer reset occurs.
Bit 28	SWRSTF	0x0	ro	Software reset flag Sety by hardware. Cleared by writing to the RSTFC bit. 0: No software reset occurs 1: Software reset occurs.
Bit 27	PORRSTF	0x1	ro	POR/LVR reset flag Sety by hardware. Cleared by writing to the RSTFC bit. 0: No POR/LVR reset occurs 1: POR/LVR reset occurs.
Bit 26	NRSTF	0x1	rw	NRST pin reset flag Sety by hardware. Cleared by writing to the RSTFC bit. 0: No NRST pin reset occurs 1: NRST pin reset occurs
Bit 25	Reserved	0x0	resd	Kept at its default value.
Bit 24	RSTFC	0x0	rw	Reset flag clear Cleared by writing 1 through software. 0: No effect 1: Clear the reset flag.
Bit 23: 2	Reserved	0X00000	resd	Kept at its default value.
Bit 1	LICKSTBL	0x0	ro	LICK stable 0: LICK is not ready.

				1: LICK is ready.
Bit 0	LICKEN	0x0	rw	LICK enable 0: Disabled 1: Enabled

4.3.11 Additional register1 (CRM_MISC1)

Bit	Name	Reset value	Type	Description
Bit 31: 28	CLKOUTDIV	0x0	rw	Clock output division Set the frequency division of CLKOUT. 0xxx: Clock output 1000: Clock output divided by 2 1001: Clock output divided by 4 1010: Clock output divided by 8 1011: Clock output divided by 16 1100: Clock output divided by 64 1101: Clock output divided by 128 1110: Clock output divided by 256 1111: Clock output divided by 512
Bit 27: 26	Reserved	0x0	resd	Kept its default value.
Bit 25	HICKDIV	0x0	rw	HICK 6 divider selection This bit is used to select HICK or HICK /6. If the HICK/6 is selected, the clock frequency is 8 MHz. Otherwise, the clock frequency is 48 MHz. 0: HICK/6 1: HICK 1.When the HICK is used as PLL clock source, the HICKDIV must not change during PLL enable. 2. In any case, HICK always input 4 MHz to PLL
Bit 24	USBBUFS	0x0	rw	USB buffer size selection 0: USB buffer size is 512 byte 1: USB buffer size is 768~1280 byte.
Bit 23: 17	Reserved	0x00	resd	Kept at its default value.
Bit 16	CLKOUT_SEL[3]	0x0	rw	Clock output selection Used with CRM_CFG register bit 26: 24.
Bit 15: 8	Reserved	0x00	resd	Keep at its default value.
Bit 7: 0	HICKCAL_KEY	0x00	rw	HICK calibration key The HICKCAL [7:0] can be written only when this field is set 0x5A.

4.3.12 Additional register2 (CRM_MISC2)

Bit	Name	Reset value	Type	Description
Bit 31: 17	Reserved	0x0000	resd	Kept at its default value.
Bit 16	CLK_TO_TMR	0x0	rw	CLKOUT internally connected to timer 10 channel 1 0: Not connected 1: Connected
Bit 15: 0	Reserved	0x0000	resd	Kept its default value.

4.3.13 Additional register3 (CRM_MISC3)

Bit	Name	Reset value	Type	Description
Bit 31: 10	Reserved	0x000000	resd	Kept at its default value.
Bit 9	HICK_TO_SCLK	0x0	rw	HICK as system clock frequency select When the HICK is selected as the clock source SCLKSEL, the frequency of SCLK is: 0: Fixed 8 MHz, that is, HICK/6 1: 48 MHz or 8 MHz, depending on theHICKDIV
Bit 8	HICK_TO_USB	0x0	rw	USB 48 MHz clock source select 0: PLL or PLL division 1: HICK or HICK/6 Note: Since USB must work at 48 MHz, HICKDIV=1 must be guaranteed to ensure that the HICK 48 MHz is selected as the clock source of USB 48 MHz.
Bit 7: 6	Reserved	0x0	resd	Kept its default value.
Bit 5: 4	AUTO_STEP_EN	0x0	rw	Auto step-by-step system clock switch enable When the system clock source is switched from others to the PLL or when the AHB prescaler is changed from large to small (system frequency is from small to large), it is recommended to enable the auto step-by-step system clock switch if the operational target is larger than 108 MHz,. Once it is enabled, the AHB bus is halted by hardware till the completion of the switch. During this switch period, the DMA remain working, and the interrupt events are recorded and then handled by NVIC when the AHB bus resumes. 00: Disabled 01: Reserved 10: Reserved 11: Enabled. When AHBDIV or SCLKSEL is modified, the auto step-by-step system clock switch is activated automatically.
Bit 3: 0	Reserved	0xd	resd	It is fixed to 0xd. Do not change.

4.3.14 Interrupt map register (CRM_INTMAP)

Bit	Name	Reset value	Type	Description
Bit 31: 1	Reserved	0x0000 0000	resd	Kept at its default value.
Bit 0	USBINTMAP	0x0	rw	USBFS interrupt remap 0: USBFS uses the 19th USBFS_H and the 20th USBFS_L interrupt 1: USBDEV uses the 73rd USBFS_MAPH and the 74th USBFS_MAPL interrupt.

5 Flash memory controller (FLASH)

5.1 Flash memory introduction

Flash memory is divided into four parts: main Flash memory, external memory, information block and Flash memory registers.

- Main Flash memory is up to 256 KB.
- Externa memory is up to 16 MB
- Information block consists of 16 KB boot memory and the user system data area. The boot loader uses USART1, USART2 or USB (DFU) serial interface for ISP programming.

Main Flash memory contains bank 1 only, 256 KB, including 128 sectors, 2 K per sector.

External memory size is up to16 MB, including 4096 sectors, 4 K per sector.

Table 5-1 Flash memory architecture(256 K)

Block		Name	Address range
Main memory	Bank 1 256 KB	Sector 0	0x0800 0000 – 0x0800 07FF
		Sector 1	0x0800 0800 – 0x0800 0FFF
		Sector 2	0x0800 1000 – 0x0800 17FF
		…	…
		Sector 127	0x0803 F800 – 0x0803 FFFF
External memory	16 MB	Sector 0	0x0840 0000 – 0x0840 0FFF
		Sector 1	0x0840 1000 – 0x0840 1FFF
		Sector 2	0x0840 2000 – 0x0840 2FFF
		…	…
		Sector 4095	0x093F F000 – 0x093F FFFF
Information block		16 KB boot memory	0x1FFF B000 – 0x1FFF EFFF
		48 B user system data	0x1FFF F800 – 0x1FFF F82F

The main memory contains bank 1 (128 Kbytes), including 128 sectors and 1 Kbyte per sector.

External memory size can be up to 16 Mbytes, including 4096 sectors, and 4 Kbytes per sector.

Table 5-2 Flash memory architecture(128 K)

Block		Name	Address range
Main memory	Bank1 128KB	Sector 0	0x0800 0000 – 0x0800 03FF
		Sector 1	0x0800 0400 – 0x0800 07FF
		Sector 2	0x0800 0800 – 0x0800 0BFF
		…	…
		Sector 127	0x0801 FC00 – 0x0801 FFFF
External memory	16MB	Sector 0	0x0840 0000 – 0x0840 0FFF
		Sector 1	0x0840 1000 – 0x0840 1FFF
		Sector 2	0x0840 2000 – 0x0840 2FFF
		…	…
		Sector 4095	0x093F F000 – 0x093F FFFF
Information block		16 KB boot memory	0x1FFF B000 – 0x1FFF EFFF
		48 B user system data	0x1FFF F800 – 0x1FFF F82F

The main memory contains bank 1 (64 Kbytes), including 64 sectors and 1 Kbyte per sector.

External memory size can be up to 16 Mbytes, including 4096 sectors, and 4 Kbytes per sector.

Table 5-3 Flash memory architecture(64 K)

Block		Name	Address range
Main memmory	Bank 1 64 KB	Sector 0	0x0800 0000 – 0x0800 03FF
		Sector 1	0x0800 0400 – 0x0800 07FF
		Sector 2	0x0800 0800 – 0x0800 0BFF
		…	…
		Sector 63	0x0800 FC00 – 0x0800 FFFF
External memory	16 MB	Sector 0	0x0840 0000 – 0x0840 0FFF
		Sector 1	0x0840 1000 – 0x0840 1FFF
		Sector 2	0x0840 2000 – 0x0840 2FFF
		…	…
		Sector 4095	0x093F F000 – 0x093F FFFF
Information block		16 KB boot memory	0x1FFF B000 – 0x1FFF EFFF
		48 B user system data	0x1FFF F800 – 0x1FFF F82F

External memory

External Flash memory controls the external SPI Flash through SPIM transmission interface. It supports ciphertext protection. User can decide whether or not to encrypte the data by setting the EXT_FLASH_KEYx bit of the user system data area, and can control the range to be encrypted with the FLASH_DA register.

AHB clock (HCLK), used as a reference clock of SPIM, provides HCLK/2 clock for external SPIM via SPIM interface.

SPIM=External SPI Flash memory expansion (program execution/data store/program and data encrypted)

Note: SPIM has to be accessed by word or half-word.

Figure 5-1 External memory ciphertext protection

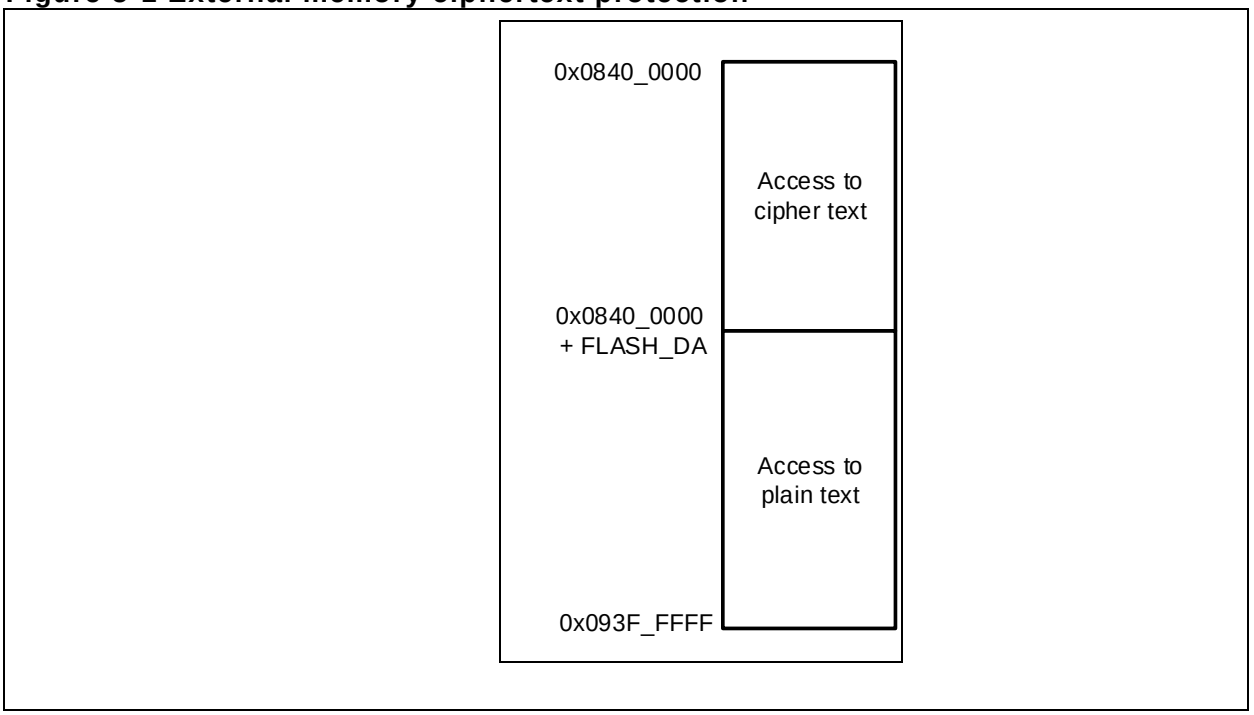


Figure 5-2 Reference circuit for external memory

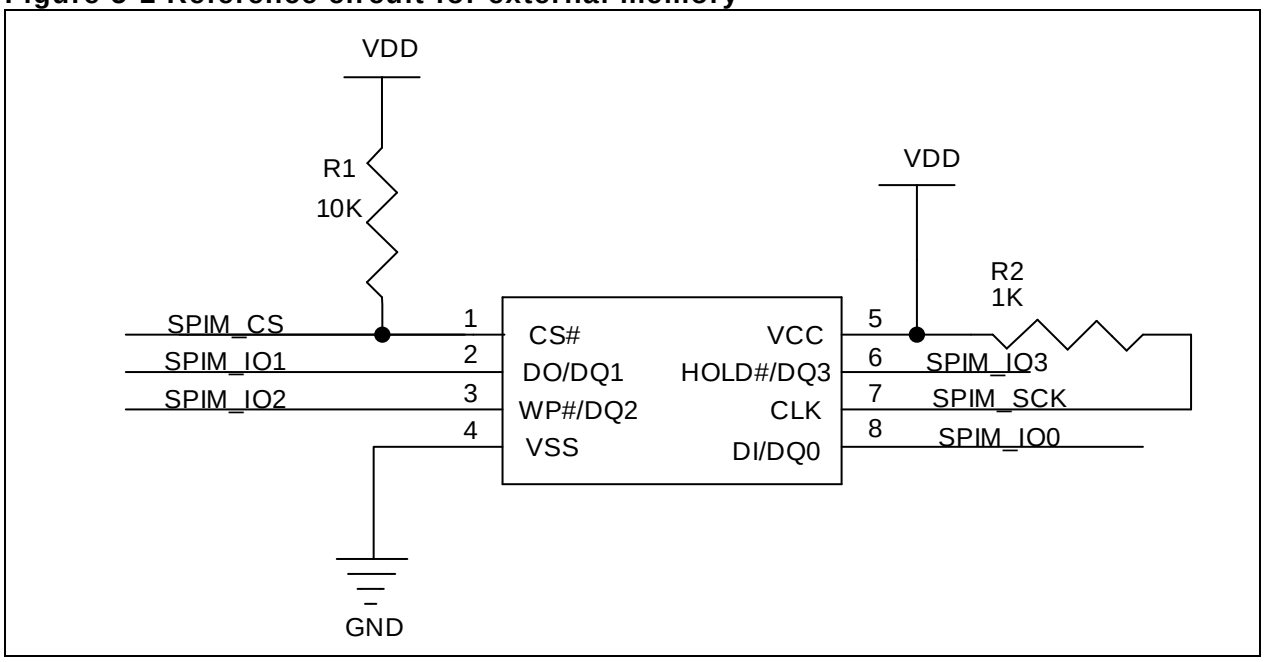

Table 5-4 Instruction set supported by external memory

Instruction	Code	FLASH_SELECT register config.	Description
Write Enable	0x06	0x1/0x2	Both 0x1 and 0x2 Flash must support 0x06 instruction
Quad Page Program	0x32	0x1/0x2	Both 0x1 and 0x2 Flash must support 0x32 instruction
Sector Erase	0x20	0x1/0x2	Both 0x1 and 0x2 Flash must support 0x20 instruction
Chip Erase	0xC7	0x1/0x2	Both 0x1 and 0x2 Flash must support 0XC7 instruction
Read Status Register	0x05	0x1/0x2	Both 0x1 and 0x2 Flash must support 0x05 instruction
Quad I/O Read	0xEB	0x1/0x2	Both 0x1 and 0x2 Flash must support 0xEB instruction 24-bit Addr + 6x Dummy cycle
Volatile status Register write enable	0x50	0x1	When 0x1 Flash is selected, the hardware sends a command automatically to configure the Quad Enable bit of the Flash Status Register 0x1 Flash memory must support: 0x50 and 0x01 or 0x50 and 0x31
Write Status Register-1	0x01		
Write Status Register-2	0x31		

Note:

1. If it is mandatory to set the QE to 1 in the Status Register before executing 0x32 and 0xEB, then 0x1 Flash is selected by seting the FLASH_SELECT register to 0x1.

2. If it is not required to set the QE bit before executing 0x32 and 0xEB, then 0x2 Flash is selected by seting the FLASH_SELECT register to 0x2.

For example,

If FLASH_SELECT register is set to 0x1:

D25Q127C, GD25Q64C,GD25Q32C,GD25Q16C,GD25Q80C and W25Q128V Flash memory are supported.

If FLASH_SELECT register is set as 0x2: EN25F20A and EN25QH128A Flash memory are supported.

User system data area

The system data will be read from the information block of Flash memory whenever a system reset occurs, and is saved in the user system data register (FLASH_USD)and erase programming protection status register (FLASH_EPPS).

Each system data occupies two bytes, where the low bytes corresponds to the contents in the system data area, and the high bytes represent the inverse code that is used to verify the correctness of the selected bit. When the high byte is not equal to the inverse code of the low byte (except when both high and low byte are all 0xFF), the system data loader will issue a system data error flag (USDERR) and the corresponding system data and their inverse codes are forced 0xFF.

Note: The update of the contents in the user system data area becomes effective only after a system reset.

Table 5-5 User system data area

Address	Bit	Description	
0x1FFF_F800	[7: 0]	FAP[7: 0]: Flash memory access protection (Access protection enable/disable result is stored in the FLASH_USD[1] register) 0xA5: Disabled 0xFF: Enabled (enabled by erasing USD area, while nFAP also remains 0xFF) Others: reserved	
	[15: 8]	nFAP[7: 0]: Inverse code of FAP[7: 0]	
	[23: 16]	SSB[7: 0]: System configuration byte (it is stored in the FLASH_USD[9: 2] register)	
		Bit 7: 3	Reserved
		Bit 2 (nSTDBY_RST)	0: Reset occurs when entering Standby mode 1: No reset occurs when entering Standby mode
		Bit 1 (nDEPSLP_RST)	0: Reset occurs when entering Deepsleep mode 1: No reset occurs when entering Deepsleep mode
		Bit 0 (nWDT_ATO_EN)	0: Watchdog is enabled 1: Watchdog is disabled
	[31: 24]	nSSB[7: 0]: Inverse code of SSB[7: 0]	
0x1FFF_F804	[7: 0]	Data0[7: 0]: User data 0 (It is stored in the FLASH_USD[17:10] register)	
	[15: 8]	nData0[7: 0]: Inverse code of Data0[7: 0]	
	[23: 16]	Data1[7: 0]: User data 1 (It is stored in the FLASH_USD[25: 18] register)	
	[31: 24]	nData1[7: 0]: Inverse code of Data1[7: 0]	
0x1FFF_F808	[7: 0]	EPP0[7: 0]: Flash erase/write protection byte 0 (in the FLASH_EPPS[7: 0]) For 256 K Flash memory, this field is used to protect sector 0 ~ 15 of main Flash memory. Each bit takes care of two sectors (2 KB/sector) 0: Erase/write protection is enabled 1: Erase/write protection is disabled	
	[15: 8]	nEPP0[7: 0]: Inverse code of EPP0[7: 0]	
	[23: 16]	EPP1[7: 0]: Flash erase/write protection byte 1 (stored in the FLASH_EPPS[15: 8]) For 256 K Flash memory, this field is used to protect sector 16~ 31 of main Flash memory. Each bit takes care of two sectors (2 KB/sector) 0: Erase/write protection is enabled 1: Erase/write protection is disabled	
	[31: 24]	nEPP1[7: 0]: Inverse code of EPP1[7: 0]	
0x1FFF_F80C	[7: 0]	EPP2[7: 0]: Flash erase/write protection byte 2 (stored in the FLASH_EPPS[23: 16]) For 256 K Flash memory, this field is used to protect sector 32~ 47 of main Flash memory. Each bit takes care of two sectors (2 KB/sector) 0: Erase/write protection is enabled 1: Erase/write protection is disabled	
	[15: 8]	Inverse code of nEPP2[7: 0]: EPP2[7: 0]	
	[23: 16]	EPP3[7: 0]: Flash erase/write protection byte 3 (stored in the FLASH_EPPS[31: 24]) For 256 K Flash memory, bit 6:0 is used to protect sector 48~ 61 of main Flash memory. Each bit takes care of two sectors (2 KB/sector) For 128 K and less, bit 6:0 is used to protect sector 96~ 127 of main Flash memory. Each bit takes care of four sectors (1 KB/sector) Bit 7 is used to protect the remaining sectors and external memory. 0: Erase/write protection is enabled 1: Erase/write protection is disabled	
	[31: 24]	nEPP3[7: 0]: Inverse code of EPP3[7: 0]	
0x1FFF_F810	[7: 0]	EOPB0[7: 0]: Extended system options Bit 7: 2: Reserved Bit 1: 0: 0x0: 64 KB of SRAM 0x1: 16 KB of SRAM 0x2: 64 KB of SRAM 0x3: 32 KB of SRAM.	
	[15: 8]	nEOPB0[7: 0]: Inverse code of EOPB0[7: 0]	
	[31: 16]	Reserved	
0x1FFF_F814	[7: 0]	Data2[7: 0]: User data 2	
	[15: 8]	nData2[7: 0]: Inverse code of Data2[7: 0]	
	[23: 16]	Data3[7: 0]: User data 3	

Address	Bit	Description
	[31: 24]	nData3[7: 0]: Inverse code of Data3[7: 0]
0x1FFF_F818	[7: 0]	Data4[7: 0]: User data 4
	[15: 8]	nData4[7: 0]: Inverse code of Data4[7: 0]
	[23: 16]	Data5[7: 0]: User data 5
	[31: 24]	nData5[7: 0]: Inverse code of Data5[7: 0]

	[31: 24]	nEXT_FLASH_KEY3[7: 0]: Inverse code of EXT_FLASH_KEY3[7: 0]
0x1FFF_F828	[7: 0]	EXT_FLASH_KEY4[7: 0]: External memory ciphertext encryption key byte 4
	[15: 8]	nEXT_FLASH_KEY4[7: 0]: Inverse code of EXT_FLASH_KEY4[7:0]
	[23: 16]	EXT_FLASH_KEY5[7: 0]: External memory ciphertext encryption key byte 5
	[31: 24]	nEXT_FLASH_KEY5[7: 0]: Inverse code of EXT_FLASH_KEY5[7: 0]
0x1FFF_F82C	[7: 0]	EXT_FLASH_KEY6[7: 0]: External memory ciphertext encryption key byte 6
	[15: 8]	nEXT_FLASH_KEY6[7: 0]: Inverse code of EXT_FLASH_KEY6[7: 0]
	[23: 16]	EXT_FLASH_KEY7[7: 0]: External memory ciphertext encryption key byte 7
	[31: 24]	nEXT_FLASH_KEY7[7: 0]: Inverse code of EXT_FLASH_KEY7[7: 0]

5.2 Flash memory operation

5.2.1 Unlock/lock

After reset, main memory is protected, by default. FLASH_CTRL cannot be written. Write and erase operation can be performed only when the Flash memory is unlocked.

Unlock procedure:

Flash memory block can be unlocked by writing KEY1 (0x45670123) and KEY2 (0xCDEF89AB) to the FLASH_UNLOCKx register.

Note: Writing incorrect key sequence leads to a bus error and the Flash memory is also locked until the next reset.

Lock procedure:

Flash memory block can be locked by setting the OPLK bit in the FLASH_CTRLx register.

5.2.2 Erase operation

Erase operation must be done before programming. Flash memory erase includes mass erase and sector erase.

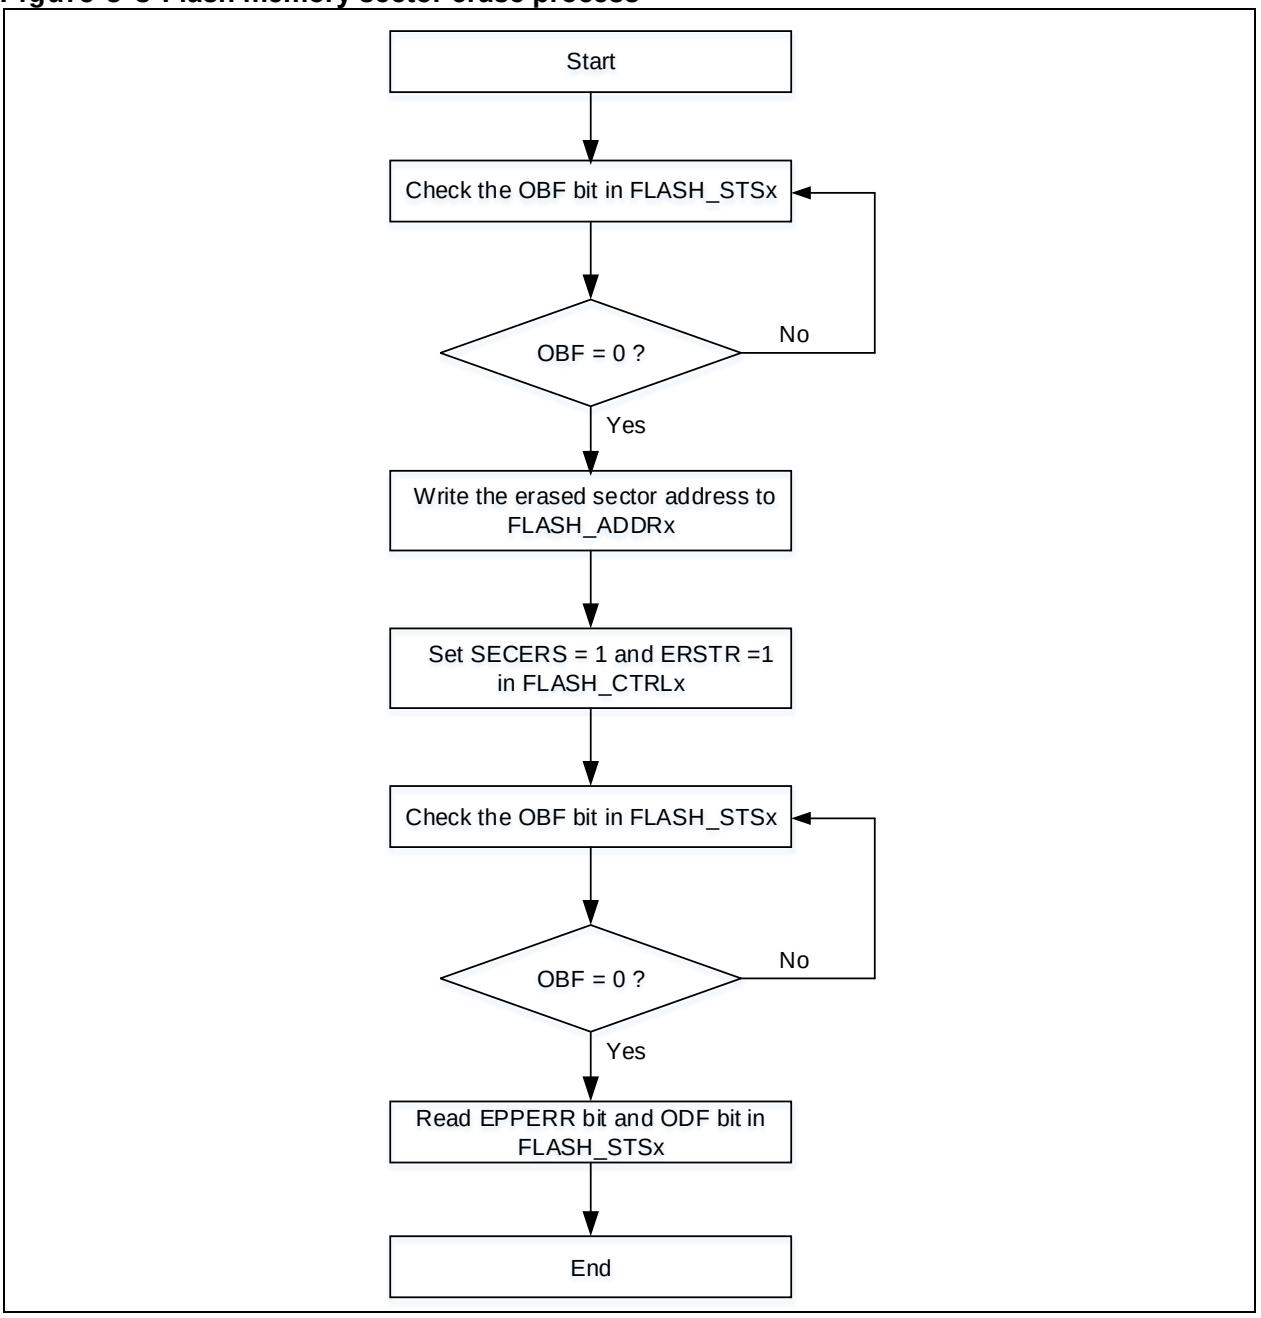
Sector erase

Any sector in the Flash memory can be erased with sector erase function. Below should be followed during erase:

- Check the OBF bit in the FLASH_STS register to confirm that there is no other programming operation in progress;
- Write the sectors to be erased in the FLASH_ADDR register
- Set the SECERS and ERSTR bit to 1 in the FLASH_CTRL register to enable sector erase
- Wait until the OBF bit becomes “0” in the FLASH_STS register. Read the EPPERR bit and ODF bit

in the FLASH_STS register to verify the erased sectors.

Figure 5-3 Flash memory sector erase process



Mass erase

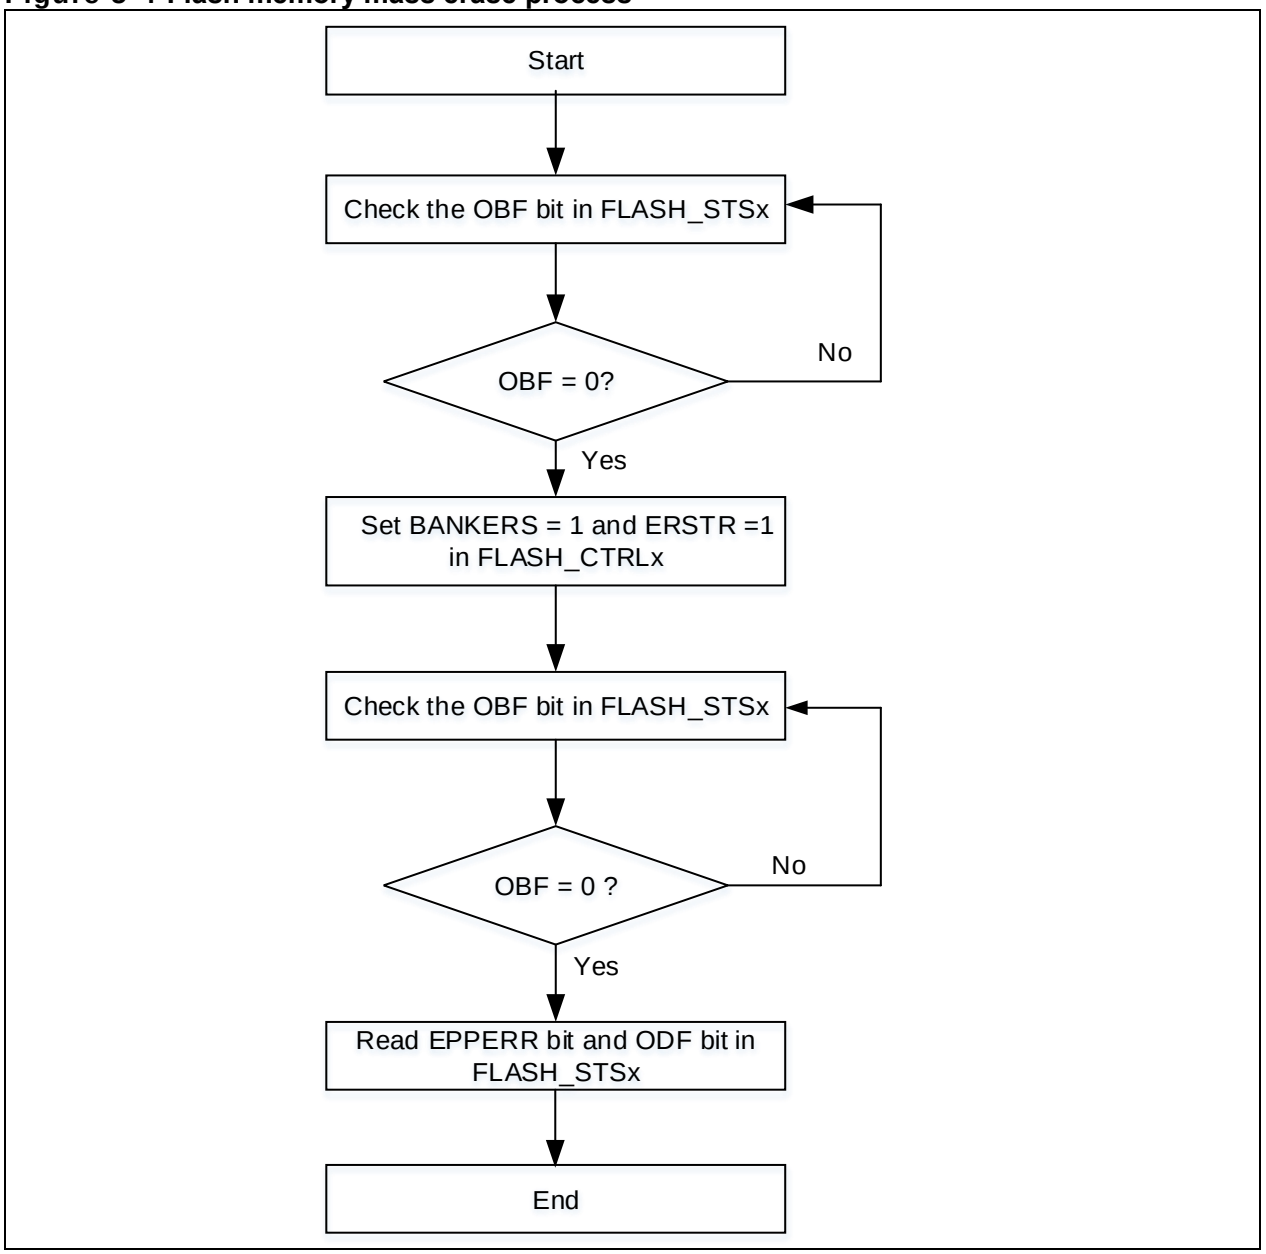
Mass erase function can erase the whole Flash memory.

The following process is recommended:

- Check the OBF bit in the FLASH_STS register to confirm that there is no other programming operation in progress;
- Set the BANKERS and ERSTR bit in the FLASH_CTRL register to enable mass erase;
- Wait until the OBF bit becomes “0” in the FLASH_STS register. Read the EPPERR bit and ODF bit in the FLASH_STS register to verify erase results.

Note: Read operation to the Flash memory during erase will halt CPU until the completion of erase.

Figure 5-4 Flash memory mass erase process



5.2.3 Programming operation

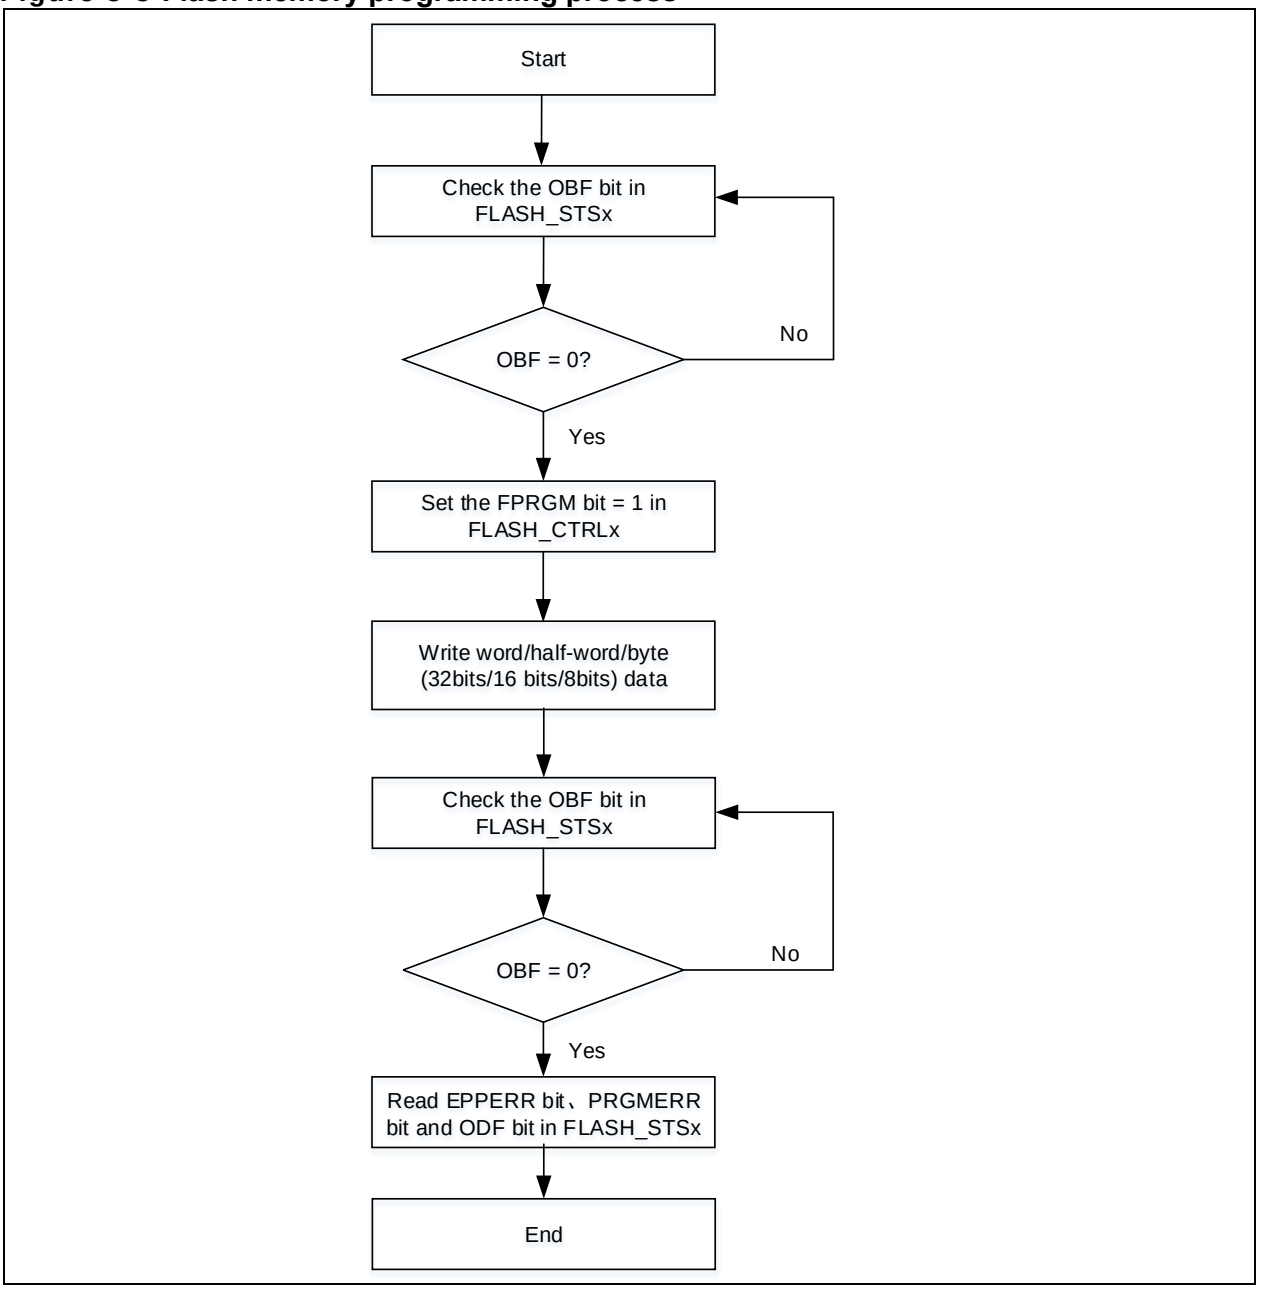
The Flash memory can be programmed with 32 bits, 16 bits or 8 bits at a time.

The following process is recommended:

- Check the OBF bit in the FLASH_STS register to confirm that there is no other programming operation in progress;
- Set the FPRGM bit in the FLASH_CTRL register, so that the Flash memory programming instructions can be received;
- Write the data (word/half-word/byte) to be programmed to the designated address;
- Wait until the OBF bit in the FLASH_STS register becomes “0”, read the EPPERR, PRGMERR and ODF bit to verify the programming result.

Note: 1. When the address to be written is not erased in advance, the programming operation is not executed unless the data to be written is all 0. In this case, a programming error is reported by the PRGMERR bit in the FLASH_STSx register.
2. Read operation to the Flash memory during tprogramming will halt CPU until the completion of programming.

Figure 5-5 Flash memory programming process



5.2.4 Read operation

Flash memory can be accessed through AHB bus of the CPU.

5.3 External memory operation

External memory has the same operation method as that of Flash memory, including read, unlock, erase and programming, except that the external memory only supports 32-bit and 16-bit operations, rather than 8 bits.

5.4 User system data area operation

5.4.1 Unlock/lock

After reset, user system data area is protected, by default. Write and erase operations can be performed only after the Flash memory is unlocked and then the user system data area is unlocked.

Unlock procedure:

Flash memory block can be unlocked by writing KEY1 (0x45670123) and KEY2 (0xCDEF89AB) to the FLASH_UNLOCK register;

When KEY1 (0x45670123) and KEY2 (0xCDEF89AB) is written to the FLASH_USD_UNLOCK register, the USDULKS bit in the FLASH_CTRL register will be automatically set by hardware, indicating that the user system data area can be programmed (write/erase).

Note: Writing an incorrect key sequence leads to bus error and the Flash memory is also locked until the next reset.

Lock procedure:

User system data area is locked by clearing the USDULKS bit in the FLASH_CTRL register by software.

5.4.2 Erase operation

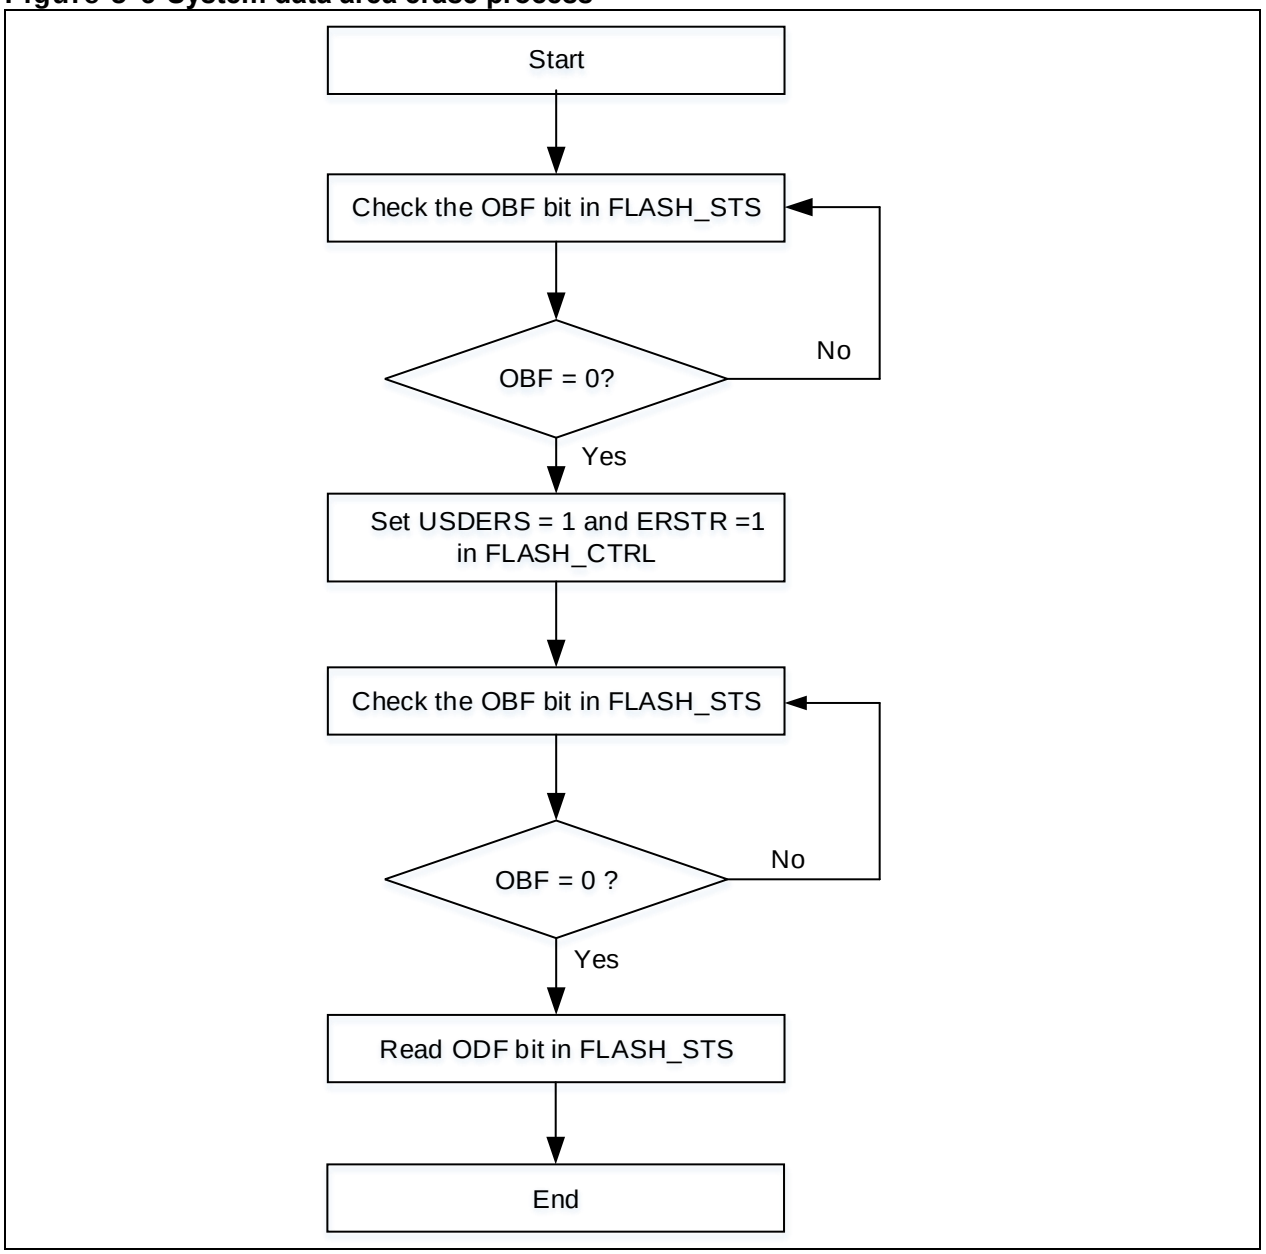
Erase operation must be done before programming. User system data area can be erased independently.

Below should be followed during erase:

- Check the OBF bit in the FLASH_STS register to confirm that there is no other programming operation in progress;
- Set the USDERS and ERSTR bit in the FLASH_CTRL register to enable erase operation;
- Wait until the OBF bit becomes “0” in the FLASH_STS register. Read the ODF bit in the FLASH_STSx register to verify erase results.

Note: Read operation to the Flash memory during programming will halt CPU until the completion of erase. Writing a value other than 0xA5 to FAP is prohibited.

Figure 5-6 System data area erase process



5.4.3 Programming operation

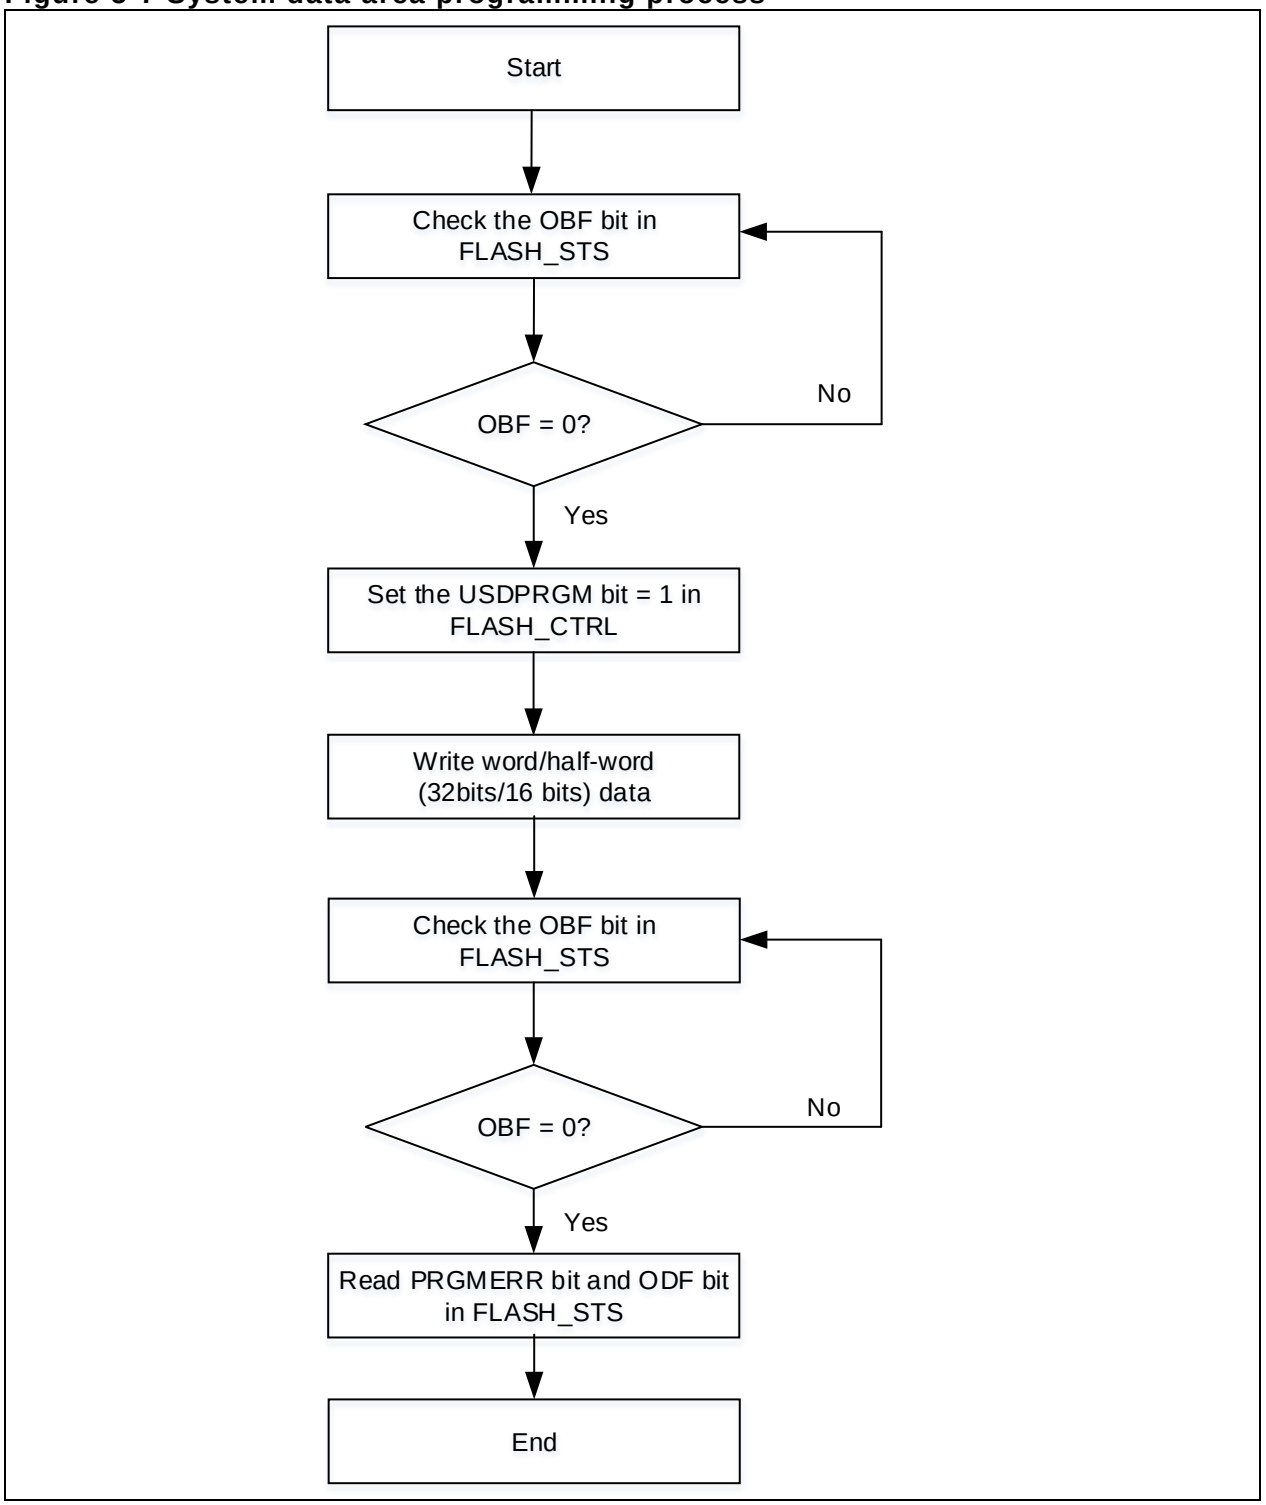
The User system data area can be programmed with 16 bits at a time.

The following process is recommended:

- Check the OBF bit in the FLASH_STS register to confirm that there is no other programming operation in progress;
- Set the USDPRGM bit in the FLASH_CTRL register, so that the programming instructions for the user system data area can be received;
- Write the data (half-word) to be programmed to the designated address;
- Wait until the OBF bit in the FLASH_STS register becomes “0”, read the PRGMERR and ODF bit to verify the programming result.

Note: Read operation to the Flash memory during programming will halt CPU until the completion of programming.

Figure 5-7 System data area programming process



5.4.4 Read operation

User system data area can be accessed through AHB bus of the CPU.

5.5 Flash memory protection

Flash memory includes access and erase/program protection.

5.5.1 Access protection

When the contents in the nFAP and FAP byte are equal to 0xFF, the Flash memory access protection is enabled after a system reset. In this case, only the Flash program is allowed to read Flash memory data. This read operation is not permitted in debug mode or by booting from non-Flash memory.

When the Flash access is protected, the user can re-erase the system data area, and unlock Flash access protection (switching from protected to unprotected state will trigger mass erase on the Flash memory automatically) by wrting 0xA5 to FAP byte, and then perform a system reset. Subsequently, the system data loader will be reloaded with system data and updated with Flash memory access protection disable state (FAP byte)

Note: If the access protection bit is set in debug mode, then the debug mode has to be cleared by POR instead of system reset in order to resume access to Flash memory data.

Table 5-6 shows Flash memory access limits when Flash access protection is enabled.

Table 5-6 Flash memory access limit

Block	Access limits					
	In debug mode or boot from SRAM and boot loader			Boot from main Flash memory		
	Read	Write	Erase	Read	Write	Erase
Main Flash memory	Not allowed		Not allowed (1) (2)	Accessible		
External memory	Not allowed		Not allowed (2)	Accessible		
User system data area	Not allowed	Accessible		Accessible		

(1)Main Flash memory is cleared automatically by hardware only when the access protection is disabled;

(2)Only sector erase is forbidden. Mass erase and external memory mass erase are not affected.

5.5.2 Erase/program protection

For 256 K Flash memory, erase/program protection is performed on the basis of 2 sectors.

For 128 K and less Flash memory, rase/program protection is performed on the basis of 4 sectors.

This is used to protect the content in the Flash memory against inadvertent operation when the program crash occurs.

Erase/program operation is not permitted under one of the following events, and the EPPERR bit is set accordingly:

- Attempting to erase/program sectors (in Flash memory and its extended area) with erase/program protection enabled
- Attempting to mass erase bank 1 and external memory with sector erase/program protection enabled
- When the Flash access protection is enabled, the first 4 KB of the main Flash memory will be protected against erase/program automatically
- When the Flash access protection is enabled, the main Flash memory is protected when it is in debug mode or when it is started from non-main Flash memory.

5.6 Special functions

5.6.1 Security library settings

Security library is a defined area protected by a code in the main memory. This area is only executable but cannot be read (Except for I-Code and D-code buses), written, or deleted, unless a correct code is keyed in. Security library includes instruction security library and data security library; users can select part of or the whole security library for instruction storage, but using the whole security library for storing data is not supported.

Advantages of security library:

Security library is protected by codes so that solution providers can program core algorithm into this area;

Security library cannot be read or deleted (including ISP/IAP/SWD) but only executed unless code defined by the solution provider is keyed in;

The rest of the area can be used for secondary development by solution providers;

Solution providers can sell core algorithm with security library function and do not have to develop full solutions for every customer.

Security library helps prevent from deliberate damage or changing terminal application codes.

Note:

Security library can only be located in the main Flash memory;

Security library code must be programmed by sector, with its start address aligned with the main memory address;

Interrupt vector table will be placed on the first sector of Flash memory (sector 0), which should not be configured as security library;

Program codes to be protected by the security library should not be placed on the first sector of Flash memory;

Only I-Code bus is allowed to read instruction security library;

Only D-Code bus is allowed to read data security library;

When writing or deleting security library code, a warning message will be issued by WRPRTFLR =1 in the FLASH_STS register;

Executing mass erase in the main memory will not erase the security library.

By default, security library setting register is unreadable and write protected. To enable write access to this register, security library should be unlocked first, write 0xA35F6D24 to the SLIB_UNLOCK register, and check the SLIB_ULKF bit in the SLIB_MISC_STS register to verify if it is unlocked successfully. Then write a value into the security library setting register.

Optional CRC check for security library code is based on a sector level.

The steps to enable security library are as follows:

- Check the OBF bit in the FLASH_STS register to ensure that there is no other ongoing programming operation;
- Write 0xA35F6D24 to the SLIB_UNLOCK register to unlock security library.
- Check the SLIB_ULKF bit of SLIB_MISC_STS register to verify that it is unlocked successfully.
- Set the areas to be protected in the SLIB_SET_RANGE register, including the address of instruction and data area;
- Wait until the OBF bit becomes “0”
- Set a security libaray password in the SLIB_SET_PWD register
- Wait until the OBF bit becomes “0”
- Program the code to be saved in security library
- Perform system reset, and then reload security library setting words
- Read the SLIB_STS0/STS1 register to verify the security library settings

Steps to unlock security library:

- Write the previously set security library password to the SLIB_PWD_CLR register.
- Wait until the OBF bit becomes “0”;
- Perform system reset, and then reload security library setting word;
- Read the SLIB_STS0 register to check the security library setting.

Note: Disabling the security library will automatically perform mass erase for the main memory and erase the security library setting block.

5.7 Flash memory registers

Table 5-7 lists Flash register map and their reset values.

These peripheral registers must be accessed by words (32 bits).

Table 5-7 Flash memory interface—Register map and reset value

Register	Offset	Reset value
FLASH_PSR	0x00	0x0000 0030
FLASH_UNLOCK	0x04	0xXXXX XXXX
FLASH_USD_UNLOCK	0x08	0xXXXX XXXX
FLASH_STS	0x0C	0x0000 0000
FLASH_CTRL	0x10	0x0000 0080
FLASH_ADDR	0x14	0x0000 0000
FLASH_USD	0x1C	0x03FF FFFC
FLASH_EPPS	0x20	0xFFFF FFFF
FLASH_UNLOCK3	0x84	0xXXXX XXXX
FLASH_SELECT	0x88	0x0000 0000
FLASH_STS3	0x8C	0x0000 0000
FLASH_CTRL3	0x90	0x0000 0080
FLASH_ADDR3	0x94	0x0000 0000
FLASH_DA	0x98	0x0000 0000
SLIB_STS0	0xCC	0x0000 0000
SLIB_STS1	0xD0	0x0000 0000
SLIB_PWD_CLR	0xD4	0x0000 0000
SLIB_MISC_STS	0xD8	0x0100 0000
SLIB_SET_PWD	0xDC	0x0000 0000
SLIB_SET_RANGE	0xE0	0x0000 0000
SLIB_UNLOCK	0xF0	0x0000 0000
FLASH_CRC_CTRL	0xF4	0x0000 0000
FLASH_CRC_CHKR	0xF8	0x0000 0000

5.7.1 Flash performance select register (FLASH_PSR)

Bit	Abbr.	Reset value	Type	Description
Bit 31: 0	Reserved	0x0000 0030	resd	Kept at its default value.

5.7.2 Flash unlock register (FLASH_UNLOCK)

For Flash memory bank 1.

Bit	Abbr.	Reset value	Type	Description
Bit 31: 0	UKVAL	0xXXXX XXXX	wo	Unlock key value This is used to unlock Flash memory bank 1.

Note: All these bits are write-only, and return 0 when being read.

5.7.3 Flash user system data unlock register (FLASH_USD_UNLOCK)

Bit	Abbr.	Reset value	Type	Description
Bit 31: 0	USD_UKVAL	0xXXXX XXXX	wo	User system data Unlock key value

Note: All these bits are write-only, and return 0 when being read.

5.7.4 Flash status register (FLASH_STS)

For Flash memory bank 1 only.

Bit	Abbr.	Reset value	Type	Description
Bit 31: 6	Reserved	0x0000000	resd	Kept at its default value
Bit 5	ODF	0x0	rw	Operation done flag This bit is set by hardware when Flash memory operations (program/erase) is completed. It is cleared by writing “1”.
Bit 4	EPPERR	0x0	rw	Erase/program protection error This bit is set by hardware when programming the erase/program- protected Flash memory address. It is cleared by writing “1”.
Bit 3	Reserved	0x0	resd	Kept at its default value.
Bit 2	PRGMERR	0x0	rw	Programming error When the programming addess is not “0xFFFF”, this bit is set by hardware. It is cleared by writing “1”.
Bit 1	Reserved	0x0	resd	Kept at its default value.
Bit 0	OBF	0x0	ro	Operation busy flag When this bit is set, it indicates that Flash memory operation is in process. It is cleared when operation is completed.

5.7.5 Flash control register (FLASH_CTRL)

For Flash memory bank 1 only.

Bit	Register	Reset value	Type	Description
Bit 31: 13	Reserved	0x00000	resd	Kept at its default value
Bit 12	ODFIE	0x0	rw	Operation done flag interrupt enable 0: Interrupt is disabled; 1: Interrupt is enabled.
Bit 11,8,3	Reserved	0x0	resd	Kept its default value
Bit 10	ERRIE	0x0	rw	Error interrupt enable This bit enables EPPERR or PROGERR interrupt. 0: Interrupt is disabled; 1: Interrupt is enabled.
Bit 9	USDULKS	0x0	rw	User system data unlock success This bit is set by hardware when the user system data is unlocked properly, indicating that erase/program operation to the user system data is allowed. This bit is cleared by writing “0”, which will re-lock the user system data area.
Bit 7	OPLK	0x1	rw	Operation lock This bit is set by default, indicating that Flash memory is

				protected against operations. This bit is cleared by hardware after unlock, indicating that erase/program operation to Flash memory is allowed. Writing “1” can re-lock Flash memory operations.
Bit 6	ERSTR	0x0	rw	Erase start An erase operation is triggered when this bit is set. This bit is cleared by hardware after the completion of the erase operation.
Bit 5	USDERS	0x0	rw	User system data erase It indicates the user system data erase.
Bit 4	USDPRGM	0x0	rw	User system data program It indicates the user system data program.
Bit 2	BANKERS	0x0	rw	Mass erase It indicates mass erase operation.
Bit 1	SECERS	0x0	rw	Sector erase It indicates sector erase operation.
Bit 0	FPRGM	0x0	rw	Flash program It indicates Flash program operation.

5.7.6 Flash address register (FLASH_ADDR)

For Flash memory bank 1 only.

Bit	Register	Reset value	Type	Description
Bit 31: 0	FA	0x0000 0000	wo	Flash address Select the address of the sectors to be erased in sector erase operation.

5.7.7 User system data register (FLASH_USD)

Bit	Register	Reset value	Type	Description
Bit 31: 26	Reserved	0x00	resd	Kept at its default value
Bit 25: 18	USER_D1	0xFF	ro	User data 1
Bit 17: 10	USER_D0	0xFF	ro	User data 0
Bit 9: 2	SSB	0xFF	ro	System setting byte Includes the system setting bytes in the loaded user system data area Bit [9: 6]: Unused Bit 5: BTOPT Bit 4: nSTDBY_RST Bit 3: nDEPSLP_RST Bit 2: nWDT_ATO_EN
Bit 1	FAP	0x0	ro	Flash access protection Access to Flash memory is not allowed when this bit is set.
Bit 0	USDERR	0x0	ro	User system data error When this bit is set, it indicates that certain byte does not match its inverse code in the user system data area. At this point, this byte and its inverse code will be forced to0xFF when being read.

5.7.8 Erase/program protection status register (FLASH_EPPS)

Bit	Register	Reset value	Type	Description
Bit 31: 0	EPPS	0xFFFF FFFF	ro	Erase/Program protection status This register reflects the erase/program protection byte status in the loaded user system data.

5.7.9 Flash unlock register3 (FLASH_UNLOCK3)

For external memory only.

Bit	Register	Reset value	Type	Description
Bit 31: 0	UKVAL	0xXXXX XXXX	wo	Unlock key value This register is used to unlock SPIM.

Note: All these bits are write-only, and return 0 when being read.

5.7.10 Flash select register (FLASH_SELECT)

For external memory only.

Bit	Register	Reset value	Type	Description
Bit 31: 0	SELECT	0x0000 0000	wo	SPIM supports extended SPI Flash chip selection 0x0001: Refer to Table 6-4 0x0002: Refer to Table 6-4 Others: Reserved.

5.7.11 Flash status register3 (FLASH_STS3)

For external memory only.

Bit	Register	Reset value	Type	Description
Bit 31: 6	Reserved	0x0000000	resd	Kept at its default value
Bit 5	ODF	0x0	rw	Operation done flag This bit is set by hardware when Flash memory operations (program/erase) is completed. It is cleared by writing “1”.
Bit 4	EPPERR	0x0	rw	Erase/Program protection error This bit is set by hardware when programming the erase/program- protected Flash memory address. It is cleared by writing “1”
Bit 3	Reserved	0x0	resd	Kept at its default value
Bit 2	PRGMERR	0x0	rw	Programming error When the programming addess is not “0xFFFF”, this bit is set by hardware. It is cleared by writing “1
Bit 1	Reserved	0x0	resd	Kept at its default value
Bit 0	OBF	0x0	ro	Operation busy flag When this bit is set, it indicates that Flash memory operation is in process. It is cleared when operation is completed.

5.7.12 Flash control register3 (FLASH_CTRL3)

For external memory only.

Bit	Register	Reset value	Type	Description
Bit 31: 13	Reserved	0x00000	resd	Kept at its default value
Bit 12	ODFIE	0x0	rw	Operation done flag interrupt enable 0: Interrupt is disabled; 1: Interrupt is enabled.
Bit 11	Reserved	0x0	resd	Kept at its default value
Bit 10	ERRIE	0x0	rw	Error interrupt enable 0: Interrupt is disabled; 1: Interrupt is enabled.
Bit 9,8	Reserved	0x0	resd	Kept at its default value
Bit 7	OPLK	0x1	rw	Operation lock This bit is set by default, indicating that Flash memory is protected against operations. This bit is cleared by hardware after unlock, indicating that erase/program operation to Flash memory is allowed. Writing “1” can re-

				lock Flash memory operations.
Bit 6	ERSTR	0x0	rw	Erase start An erase operation is triggered when this bit is set. This bit is cleared by hardware after the completion of the erase operation.
Bit 5,4,3	Reserved	0x0	resd	Kept at its default value
Bit 2	CHPERS	0x0	rw	Mass erase Perform mass erase on the external memory.
Bit 1	SECERS	0x0	rw	Sector erase It indicates sector erase operation.
Bit 0	FPRGM	0x0	rw	Flash program It indicates Flash program operation.

5.7.13 Flash address register3 (FLASH_ADDR3)

For external memory only.

Bit	Register	Reset value	Type	Description
Bit 31: 0	FA	0x0000 0000	wo	Flash address Select the address of the sectors to be erased in external memory.

5.7.14 Flash decrption address register (FLASH_DA)

For external memory only.

Bit	Register	Reset value	Type	Description
Bit 31: 0	FDA	0x0000 0000	wo	Flash decryption address Set the encryption range of external memory through FLASH_DA register in the user program. 0x0840_0000 ~ (0x0840_0000+FDA-0x1): the cipher text of external memory (0x0840_0000 +FDA) ~ 0x093F FFFF: the plain text of external memory Note: The setting value of FDA must be a multiple of 4, aligned by word.

5.7.15 Flash security library status register 0 (SLIB_STS0)

For Flash security library only.

Bit	Register	Reset value	Type	Description
Bit 31: 4	Reserved	0x0000000	resd	Kept at its default value
Bit 3	SLIB_ENF	0x0	ro	SLIB_ENF: sLib enable flag When this bit is set, it indicates that the main Flash memory is partially or completely (depending on the setting of SLIB_STS1) used as security library code.
Bit 2: 0	Reserved	0x0	resd	Kept at its default value

5.7.16 Flash security library status register 1 (SLIB_STS1)

For Flash security library only

Bit	Register	Reset value	Type	Description
Bit 31: 22	SLIB_ES	0x000	ro	Security library end sector 0: Sector 0 1: Sector 1 2: Sector 2 … 62: Sector 62
Bit 21: 11	SLIB_DAT_SS	0x000	ro	Security library data start sector 0: Invalid sector 1: Sector 1 2: Sector 2 … 62: Sector 62 0x7FF: No security library data area
Bit 10：0	SLIB_SS	0x000	ro	Security library start sector 0: Sector 0 1: Sector 1 2: Sector 2 … 62: Sector 62

5.7.17 Flash security library password clear register (SLIB_PWD_CLR)

For Flash security library only.

Bit	Register	Reset value	Type	Description
Bit 31:0	SLIB_PCLR_VAL	0x0000 0000	wo	Security library password clear value Entering correct security library password will unlock security library functions. The write status of this register is reflected in the bit 0 and bit 1 in the SLIB_MISC_STS register.

5.7.18 Security library additional status register (SLIB_MISC_STS)

For Flash security library only.

Bit	Register	Reset value	Type	Description
Bit 31:25	Reserved	0x00	resd	Kept at its default value
Bit 24: 16	SLIB_RCNT	0x100	ro	Security library remaining count It is decremented from 256 to 0.
Bit 15: 3	Reserved	0x0000	resd	Kept at its default value
Bit 2	SLIB_ULKF	0x0	ro	Security library unlock flag When this bit is set, it indicates that sLib-related setting registers can be configured.
Bit 1	SLIB_PWD_OK	0x0	ro	Security library password ok This bit is set by hardware when the password is correct.
Bit 0	SLIB_PWD_ERR	0x0	ro	Security library password error This bit is set by hardware when the password is incorrect and the setting value of the password clear register is different from 0xFFFF FFFF. Note: When this bit is set, the hardware will no longer agree to re-program the password clear register until the next reset.

5.7.19 Security library password setting register (SLIB_SET_PWD)

For Flash security library password setting.

Bit	Register	Reset value	Type	Description
Bit 31: 0	SLIB_PSET_VAL	0x0000 0000	wo	Security library password setting value Note: This register can be written only after unlocking security library lock. It is used to set up the startup password of security library. Values of 0xFFFF_FFFF and 0x0000_0000 are invalid.

5.7.20 Security library address setting register (SLIB_SET_RANGE)

For Flash security library address setting.

Bit	Register	Reset value	Type	Description
Bit 31: 22	SLIB_ES_SET	0x000	wo	Security library end sector setting Theses bits are used to set the security library end sector. 0: Sector 0 1: Sector 1 2: Sector 2 … 62: Sector 62 Note: For 256 K Flash memory, this register range is from sector 0 to 30.
Bit 21: 11	SLIB_DSS_SET	0x000	wo	Security library data start sector setting These bits are used to set the security library start sector. 0: Invalid sector. Setting it will cause security library to fail to start. 1: Sector 1 2: Sector 2 … 62: Sector 62 0x7FF: No security library data area. Note: For 256 K Flash memory, this register range is from sector 0 to 30 or 0x7FF.
Bit 10: 0	SLIB_SS_SET	0x000	wo	Security library start sector setting These bits are used to set the security library start sector. 0: Sector 0 1: Sector 1 2: Sector 2 … 62: Sector 62 Note: For 256 K Flash memory, this register range is from sector 0 to 30.

Note: All these bits are write-only, and return 0 when being read.
This register can be written only after unlocking security library lock.

5.7.21 Security library unlock register (SLIB_UNLOCK)

For Flash security library unlock setting.

Bit	Register	Reset value	Type	Description
Bit 31: 0	SLIB_UKVAL	0x0000 0000	wo	Security library unlock key value Fixed key value is 0xA35F_6D24, used for security library setting register unlock

Note: All these bits are write-only, and return 0 when being read.

5.7.22 Flash CRC check control register (FLASH_CRC_CTRL)

For main Flash memory.

Bit	Register	Reset value	Type	Description
Bit 31: 15	Reserved	0x00	wo	Kept at its default value
Bit 14	CRC_STRT	0x0	wo	CRC start Set this bit to enable user code or security library code CRC calibration. This bit is cleared automatically after the hardware enables CRC.
Bit 13: 7	CRC_SN	0x000	wo	CRC calibration sector numbler Set the number of the CRC calibarion, in terms of sectors.
Bit 6: 0	CRC_SS	0x000	wo	CRC calibration start sector Set the start sector for this CRC calibration. 0x0: Sector 0 0x1: Sector 1 …

Note: All these bits are write-only. Reading them has no effect.

5.7.23 Flash CRC check result register (FLASH_CRC_CHKR)

For main Flash memory or security library.

Bit	Register	Reset value	Type	Description
Bit 31: 0	CRC_CHKR	0x0000 0000	ro	CRC check result

Note: All these bits are write-only. Reading them has no effect.

6 General-purpose I/Os (GPIOs)

6.1 Introduction

AT32F413 support up to 55 bidirectional I/O pins, which are grouped as five categories, namely PA, PB, PC, PD and PF. Each of the GPIO group provides up to 16 I/O pins that feature communication, control and data collection. In addition, their main features also include:

- Supports general-purpose I/O (GPIO) or multiplexed function I/O (IOMUX), which will be detailed in this chapter and the subsequent sections
- Each pin can be configured by software as floating input, pull-up/pull-down input, analog input/output, push-pull/open-drain output, multiplexed push-pull/open-drain output
- Each pin's output drive capability is configureable by software
- Each pin can be configured as external interrupt input
- Each pin can be locked

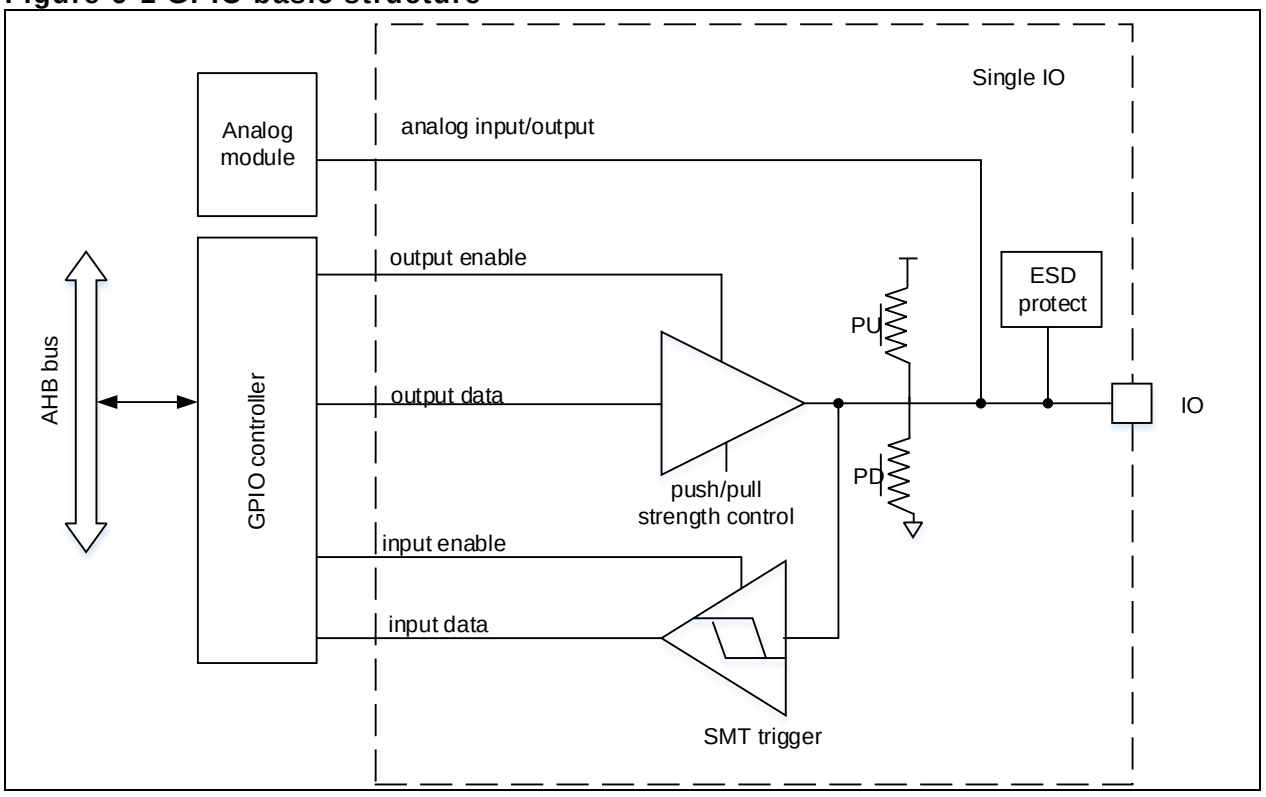
6.2 Function overview

6.2.1 GPIO structure

Each of the GPIO pins can be configured by software as four input modes (floating, pull-up/pull-down and analog input) and four output modes (open-drain, push-pull, alternate function push-pull/open-drain output)

Each I/O port bit can be programmed flexibly. However, I/O port registers must be accessed by 32-bit words (half-word/byte access is not supported).

Figure 6-1 GPIO basic structure



6.2.2 GPIO reset status

After power-on or system reset, all pins are configured as floating input mode except JATG-related pins. JTAG pin configuration are as follows:

- PA15/JTDI, PA13/JTMS and PB4/JNTRST in pull-up input mode;
- PA14/JTCK in pull-down input mode;
- PB3/TDO in floating input mode.

6.2.3 General-purpose input configuration

Mode	IOFC	HDRV	IOMC[1]	IOMC[0]	ODT register
Floating input	01				Unused
Pull-down input	10		000		0
Pull-up input					1

When I/O port is configured as input:

- Get I/O states by reading input data register.
- Floating input, pull-up/pull-down input is configurable
- Schmitt-trigger input is activated.
- Output is disabled.

Note: In floating input mode, it is recommended to set the unused pins as analog input mode in order to avoid leakage caused by interference from unused pins in a complex environment.

6.2.4 Analog input/output configuration

Mode	IOFC	HDRV	IOMC[1]	IOMC[0]	ODT register
Analog input/output	00		000		Unused

When I/O port is configured as analog input:

- Schmitt-trigger input is disabled.
- Digital input/output is disabled.
- Without any pull-up/pull-down resistor.

6.2.5 General-purpose output configuration

Mode	IOFC	HDRV	IOMC[1]	IOMC[0]	ODT register
Push-Pull	00	000/100: Input mode 001: Output mode, large sourcing/sinking strength 010: Output mode, normal sourcing/sinking strength 011: Output mode, normal sourcing/sinking strength 1xx: Output mode, Maximum sourcing/sinking strength			0 or 1
Open-Drain	01				0 or 1

When I/O port is configured as output:

- Schmitt-trigger input is enabled.
- Output through output register.
- Pull-up/pull-down resistors are disabled.
- In open-drain mode, forced output 0, use external pull-up resistor to output 1.
- In push-pull mode, output register is used to output 0/1.
- When CONF=10 or 11, it is used as a multiplexed output, refer to IOMUX for more details.

6.2.6 I/O port protection

Locking mechanism can freeze the I/O configuration for the purpose of protection. When LOCK is applied to a port bit, its configuration cannot be modified until the next reset or power on.

6.3 GPIO registers

Table 6-1 lists GPIO register map and their reset values. These peripheral registers must be accessed by words (32 bits).

Table 6-1 GPIO register map and reset values

Register	Offset	Reset value
GPIOx_CFGLR	0x00	0x4444 4444
GPIOx_CFGHR	0x04	0x4444 4444
GPIOx_IDT	0x08	0x0000 XXXX
GPIOx_ODT	0x0C	0x0000 0000
GPIOx_SCR	0x10	0x0000 0000
GPIOx_CLR	0x14	0x0000 0000
GPIOx_WPR	0x18	0x0000 0000
GPIOx_HDRV	0x3C	0x0000 0000

6.3.1 GPIO configuration register low (GPIOx_CFGLR) (x=A..F)

Bit	Register	Reset value	Type	Description
Bit 31: 30 Bit 27: 26 Bit 23: 22 Bit 19: 18 Bit 15: 14 Bit 11: 10 Bit 7: 6 Bit 3: 2	IOFCy	0x1	rw	GPIOx function configuration (y=0~7) In input mode (IOMCy[1: 0]=00): 00: Analog mode 01: Floating input (after reset) 10: Pull-up/pull-down input 11: Reserved In output mode (IOMCy[1: 0]!=00): 00: General-purpose push-pull output 01: General-purpose open-drain output 10: Alternate function push-pull output 11: Alternate function open-drain output
Bit 29: 28 Bit 25: 24 Bit 21: 20 Bit 17: 16 Bit 13: 12 Bit 9: 8 Bit 5: 4 Bit 1: 0	IOMCy	0x0	rw	GPIOx mode configuration (y=0~7) 00: Input mode (reset state) 01: Output mode, large sourcing/sinking strength 10: Output mode, normal sourcing/sinking strength 11: Output mode, normal sourcing/sinking strength

Note: Some port registers have different reset values. For example, some PA pins are JTAG/SWD with pull-up input by default.

6.3.2 GPIO configuration register high (GPIOx_CFGHR) (A..F)

Bit	Register	Reset value	Type	Description
Bit 31: 30 Bit 27: 26 Bit 23: 22 Bit 19: 18 Bit 15: 14 Bit 11: 10 Bit 7: 6 Bit 3: 2	IOFCy	0x1	rw	GPIOx function configuration (y=8~15) In input mode (IOMCy[1: 0]=00): 00: Analog mode 01: Floating input (reset state) 10: Pull-up/pull-down input 11: Reserved In output mode (IOMCy[1：0]!=00): 00: General-purpose push-pull output 01: General-purpose open-drain output 10: Alternate function push-pull output 11: Alternate function open-drain output
Bit 29: 28 Bit 25: 24 Bit 21: 20 Bit 17: 16 Bit 13: 12 Bit 9: 8 Bit 5: 4 Bit 1: 0	IOMCy	0x0	rw	GPIOx mode configuration (y=8~15) 00: Input mode (reset state) 01: Output mode, large sourcing/sinking strength 10: Output mode, normal sourcing/sinking strength 11: Output mode, normal sourcing/sinking strength

Note: Some port registers have different reset values. For example, some PB pins are JTAG/SWD with pull-up input by default.

6.3.3 GPIO input data register (GPIOx_IDT) (x=A..F)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 0	IDT	0xXXXX	ro	GPIOx input data Indicates the input status of I/O port. Each bit corresponds to an I/O.

6.3.4 GPIO output data register (GPIOx_ODT) (x=A..F)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 0	ODT	0x0000	rw	GPIOx output data Each bit represents an I/O port. As output: it indicates the output status of I/O port. 0: Low 1: High As input: it indicates the pull-up/pull-down status of I/O port. 0: Pull-down 1: Pull-up

6.3.5 GPIO set/clear register (GPIOx_SCR) (x=A..F)

Bit	Register	Reset value	Type	Description
Bit 31: 16	IOCB	0x0000	wo	GPIOx clear bit The corresponding ODT register bits are cleared by writing “1” to these bits. Writing 0 has no effect on the ODT register bits, which is equivalent to ODT register bit operations. 0: No action to the corresponding ODT bits 1: Clear the correspoinding ODT bits
Bit 15: 0	IOSB	0x0000	wo	GPIOx set bit The corresponding ODT register bits are set by writing “1” to these bits.Writing 0 has no effect on the ODT register bits, which is equivalent to ODT register bit operations. If both IOCB and IOSB are set, the IOSB has priority. 0: No action to the correspoinding ODT bits 1: Set the correspoinding ODT bits

6.3.6 GPIO clear register (GPIOx_CLR) (x=A..F)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 0	IOCB	0x0000	wo	GPIOx clear bit The corresponding ODT register bits are cleared by writing “1” to these bits. Writing o has no effect on the ODT register bit remains unchanged, which is equivalent to ODT register bit operations. 0: No action to the correspoinding ODT bits 1: Clear the correspoinding ODT bits

6.3.7 GPIO write protection register (GPIOx_WPR) (x=A..F)

Bit	Register	Reset value	Type	Description
Bit 31: 17	Reserved	0x0000	resd	Kept at its default value.
Bit 16	WPSEQ	0x0	rw	Write protect sequence Write protect enable sequence bit and WPEN bit must be enabled at the same time to achieve write protection for some I/O bits. Write protect enable bit is executed four times in the order below: write “1” -> write “0” -> write “1” -> read. Note that the value of WPEN bit cannot be modified during this period.
Bit 15: 0	WPEN	0x0000	rw	Write protect enable Each bit corresponds to an I/O port. 0: No effect. 1: Write protect

7 Multiplexed function I/Os (IOMUX)

7.1 Introduction

AT32F413 support up to 55 bi-directional I/O pins, which are grouped as five categories, namely PA, PB, PC, PD and PF. Each of the GPIO group provides up to 16 I/O pins that feature communication, control and data collection. In addition, their main features also include:

- Supports general-purpose I/O (GPIO) or multiplex I/O (IOMUX), which will be detailed in this chapter.
- Can be configured as multiplex function input/output ports by setting GPIOx_CFGLR or GPIOx_CFGHR
- Most pins support output map for several peripherals. Select different peripheral input/output through IOMUX register
- Supports external interrupt

7.2 Function overview

7.2.1 IOMUX structure

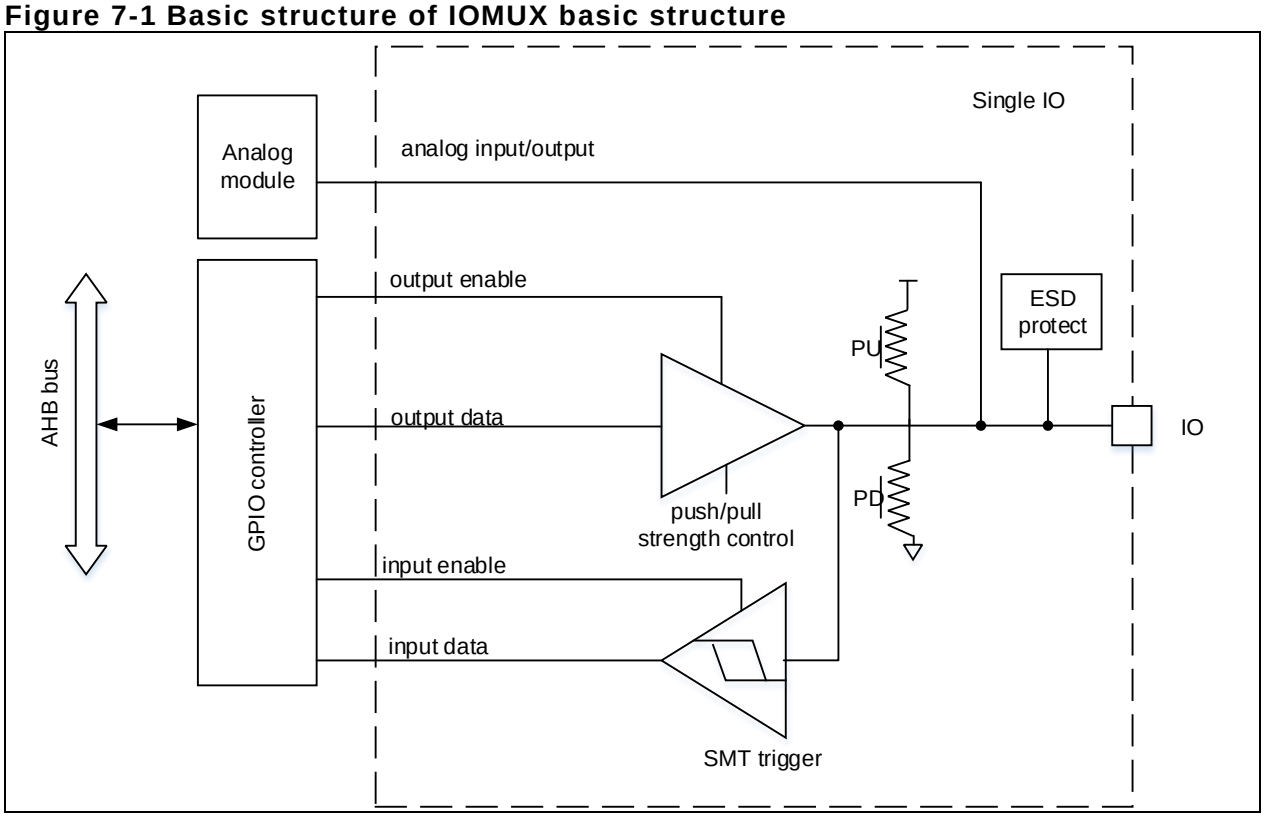
While being used as multiplexed function input, the I/O port should be configured as input modes (floating, pull-up and pull-down input)

To enable multiplexed function output, the port is configured as multiplexed function output mode (push-pull or open-drain) by setting GPIOx_CFGLR or GPIOx_CFGHR register. In this case, the pins are disconnected from GPIO controller, and controlled by IOMUX controller, instead.

To achieve bidirectional multiplexed function, the port needs to be configured as multiplexed function output modes (push-pull or open-drain), controlled by IOMUX controller.

In MUX output mode, it is possible that an I/O pin is used as output for several peripherals. Select the required multiplexed function output by setting IOMUX registers. However, when a pin is programmed as MUX IO without activating the corresponding peripheral , its output will not specified.

Figure 7-1 Basic structure of IOMUX basic structure



7.2.2 Multiplexed input configuration

When I/O ports are configured as multiplexed function input:

- Get I/O pin state by reading input data registers
- The pin be configured as floating input, pull-up or pull-down input
- Schmitt-trigger input is activated.
- Pin output is disabled.

Table 7-1 IOMUX input configuration

Mode	IOFC	HDRV	IOMC[1]	IOMC[0]	ODT register
Floating input	01				Unused
Pull-down input	10		000		0
Pull-up input					1

7.2.3 Multiplexed output or bidirectional multiplexed configuration

When an I/O port is configured as MUX output or a bidirectional MUX:

- I/O pin output depends on the peripherals.
- Schmitt-trigger input is activated.
- Pull-up/pull-down resistor is disabled.
- If the I/O pin is set as several MUX outputs by mistake, the pin output depends on map priority, refer to next section for details.
- In open-drain mode, get an I/O port state by reading input data register
- In push-pull mode, get an I/O port state by reading input data register

The MUX functions of some peripherals can be remapped to different pins. Therefore, it is possible to select the number of the desired peripheral IOMUX functions in different packages. Pin mapping is achieved by setting the IOMUX_REMAP and IOMUX_REMAPx registers (x=2,3…8).

Table 7-2 IOMUX output configuration

Mode	IOFC	HDRV	IOMC[1]	IOMC[0]
Push-Pull	10	001: Output mode, large sourcing/sinking strength		
Open-Drain	11	010: Output mode, normal sourcing/sinking strength 011: Output mode, normal sourcing/sinking strength 1xx: Output mode, maximum sourcing/sinking strength		

Note: For MUX function output or bidirectional MUX function, IOMC[1: 0] > 00 must be met.

7.2.4 IOMUX map priority

When several peripheral MUX functions are mapped to the same pin, the priorirty below should be respected:

- Hardware preemption
- JTAG debug port
- Non-timer peripherals has priority over timer peripherals
- No priority applied among several non-timer peripherals, MUX function is overlapped to the same pin

7.2.4.1 Hardware preemption

Certain pins are occupied by specific hardware functions regardless of the GPIO configuration.

Table 7-3 Hardware preemption

Pin	Enable bit	Description
PA0	PWC_CTRLSTS[8] =1	Once enabled, PA0 pin acts as WKUP function of PWC.
PA11	CRM_APB1EN[23]=1	Once enabled, PA11 pin acts as USB_DM channel.
PA12	CRM_APB1EN[23]=1	Once enabled, PA12 pin acts as USB_DP channel.
PC13	CRM_APB1EN[27]=1& (BPR_CTRL[0]=1 | BPR_RTCCAL[8]=1 | BPR_RTCCAL[7]=1)	Once enabled, PC13 pin acts as RTC channel.
PC14	CRM_BPDC[0]=1	Once enabled, PC14 pin acts as LEXT channel.
PC15	CRM_BPDC[0]=1	Once enabled, PC15 pin acts as LEXT channel.

7.2.4.2 Debug port priority

The programmed debug pins will remain its state during device debugging, regardless of their GPIO register configuration. By doing this, can the debug port be free from disturbance imposed by other peripherals.

To utilize more pins during this period, the above-mentioned remap configuration can be changed by setting the SWJTAG_MUX [2:0] bit in the IOMUX_REMAP register and SWJTAG_GMUX [2:0] bit in the IOMUX_REMAP7 register.

Table 7-4 Debug port map

SWJTAG_MUX [2: 0] or SWJTAG_GMUX [2: 0]	SWJI/O pin allocation				
	PA13/JTMS/ SWDIO	PA14/JTCK/ SWCLK	PA15/JTDI	PB3/JTDO/ TRACESWO	PB4/NJTRST
000	√	√	√	√	√
001	√	√	√	√	x
010	√	√	x	x	x
100	x	x	x	x	x
Others	-	-	-	-	-

Note: ✓indicates that this pin is forcibly allocated to debug port,while x indicates that this pin can be released to other peripherals.

7.2.4.3 Other peripheral output priority

For other peripherals, their output priority are as follows:

- Non-timer peripherals have priority over timers. In other words, when other peripherals and timers are mapped to the same pin at the same time, the timer can not be output.
- When multiple non-timer peripherals are mapped to the same pin, their output are overlapped to this pin.

7.2.5 External interrupt/wake-up lines

Each pin can be used as an external interrupt input. The corresponding pin should be configured as input mode.

7.3 Multiplexed function IO

IP name	IP pin multiplexed function	GPIO configuration
CAN1	**CAN1_MUX** 00: RX/PA11,TX/PA12 01: Unused 10: RX/ PB8,TX/ PB9 11: Unused **CAN1_GMUX** 0000: RX/PA11,TX/PA12 0001: Unused 0010: RX/ PB8,TX/ PB9 Others: Unused	CAN*_TX: push-pull multiplexed output CAN*_RX: Floating input or pull-up input

TAMPER_RTC	NA	Refer to 7.3.1.1
CLKOUT	NA	Push-pull multiplexed output
EXINT input line	NA	Floating input or pull-up or pull-down input

Note: NA indicates no pin multiplexed function. Refer to the datasheet for information on IP pin multiplexed function.

7.4 IOMUX registers

Table 7-5 shows IOMUX register map and their reset values, These peripheral registers must be accessed by words (32 bits).

Table 7-5 IOMUX register map and reset value

Register	Offset	Reset value
IOMUX_EVTOUT	0x00	0x0000 0000
IOMUX_REMAP	0x04	0x0000 0000
IOMUX_EXINTC1	0x08	0x0000
IOMUX_EXINTC2	0x0C	0x0000
IOMUX_EXINTC3	0x10	0x0000
IOMUX_EXINTC4	0x14	0x0000
IOMUX_REMAP2	0x1C	0x0000 0000
IOMUX_REMAP3	0x20	0x0000 0000
IOMUX_REMAP4	0x24	0x0000 0000
IOMUX_REMAP5	0x28	0x0000 0000

IOMUX_REMAP6	0x2C	0x0000 0000
IOMUX_REMAP7	0x30	0x0000 0000
IOMUX_REMAP8	0x34	0x0000 0000

Note: IOMUX clock must be enabled before read/write access to IOMUX_EVTOUT, IOMUX_REMAPx and IOMUX_EXINTx.

7.4.1 Event output control register (IOMUX_EVTOUT)

Bit	Register	Reset value	Type	Description
Bit 31: 8	Reserved	0x000000	resd	Kept at its default value.
Bit 7	EVOEN	0x0	rw	Event output enable Once enabled, the TXEV signal of Cortex®-M is directed to the allocated I/O port.
Bit 6: 4	SELPORT	0x0	rw	Selection IO port Select the GPIO port for EVENTOUT signal output: 000: GPIOA 001: GPIOB 010: GPIOC 011: GPIOD 100: GPIOF
Bit 3: 0	SELPIN	0x0	rw	Selection IO pin (x=A…E) Select the I/O pin of GPIOx for EVENTOUT output: 0000: Pin 0 0001: Pin 1 0010: Pin 2 0011: Pin 3 0100: Pin 4 0101: Pin 5 0110: Pin 6 0111: Pin 7 1000: Pin 8 1001: Pin 9 1010: Pin 10 1011: Pin 11 1100: Pin 12 1101: Pin 13 1110: Pin 14 1111: Pin 15

7.4.2 IOMUX remap register (IOMUX_REMAP)

Bit	Register	Reset value	Type	Description
Bit 31	SPI1_MUX	0x0	rw	SPI1 IO multiplexing Refer to bit 0 for more details.
Bit 30: 27	Reserved	0x0	resd	Kept at its default value.
Bit 26: 24	SWJTAG_MUX	0x0	rw	SWD JTAG mutiplexing These bits are used to configure SWJTGA-related I/Os as GPIOs. 000: Supports SWD and JTAG. All SWJTAG pins cannot be used as GPIOs. 001: Supports SWD and JTAG. NJTRST is disabled. PB4 can be used as GPIO. 010: Supports SWD but JTAG is disabled. PA15/PB3/PB4 can be used as GPIOs. 100: SWD and JTAG are disabled. All SWJTAG pins can be used as GPIOs. Others: No effect.
Bit 23: 21	Reserved	0x0	resd	Kept at its default value.
Bit 20	ADC2_ETO_MUX	0x0	rw	ADC2 external trigger ordinary conversion multiplexing Select external trigger input for ADC2 ordinary conversion. 0: ADC2 external trigger ordinary conversion is connected to EXINT11 1: ADC2 external trigger ordinary conversion is connected to TMR8_TRGO
Bit 19	ADC2_ETP_MUX	0x0	rw	ADC2 external trigger preempted conversion mutiplexing Select external trigger input for ADC2 preempted conversion. 0: ADC2 external trigger preempted conversion is connected to EXINT15. 1: ADC2 external trigger preempted conversion to TMR8 channel 4.
Bit 18	ADC1_ETO_MUX	0x0	rw	ADC1 external trigger regular conversion mutiplexing Select external trigger input for ADC1 ordinary conversion. 0: ADC1 external trigger ordinary conversion is connected to EXINT11. 1: ADC1 external trigger ordinary conversion TMR8_TRGO.
Bit 17	ADC1_ETP_MUX	0x0	rw	ADC1 external trigger preempted conversion multiplexing Select external trigger input for ADC1 preempted conversion. 0: ADC1 external trigger preempted conversion is connected to EXINT15. 1: ADC1 external trigger preempted conversion is connected to TMR8 channel 4.
Bit 16	TMR5CH4_MUX	0x0	rw	TMR5 channel4 multiplexing Select internal map for TMR5 channel 4. 0: TMR5_CH4 is connected to PA3. 1: TMR5_CH4 is connected to LICK. LICK can be calibrated.
Bit 15	PD01_MUX	0x0	rw	PD0/PD1 mapped on HEXT_IN / HEXT_OUT Select GPIO function map for PD0 and PD1. This is only applicable to 48-pin/64-pin packages. 0: Not PD0 and PD1 mapping 1: PD0 is mapped to HEXT_IN, while PD1 to HEXT_OUT.

Bit 14: 13	CAN1_MUX	0x0	rw	CAN1 IO multiplexing Select IO multiplexing for CAN_TX and CAN_RX. 00: RX/PA11, TX/PA12 01: Unused 10: RX/ PB8, TX/ PB9 11: Unused
Bit 12	Reserved	0x0	resd	Kept at its default value.
Bit 11: 10	TMR3_MUX	0x0	rw	TMR3 IO multiplexing Select IO multiplexing for TMR3. 00: CH1/PA6, CH2/PA7, CH3/PB0 and CH4/PB1 01: Unused 10: CH1/PB4, CH2/PB5, CH3/PB0 and CH4/PB1 11: CH1/PC6, CH2/PC7, CH3/PC8 and CH4/PC9 Note: IO multiplexing has no impact on TMR3_EXT on PD2.
Bit 9: 8	TMR2_MUX	0x0	rw	TMR2 IO multiplexing Select IO multiplexing for TMR2. 00: CH1/EXT/PA0, CH2/PA1, CH3/PA2 and CH4/PA3 01: CH1/EXT/PA15, CH2/PB3, CH3/PA2 and CH4/PA3 10: CH1/EXT/PA0, CH2/PA1, CH3/PB10 and CH4/PB11 11: CH1/EXT/PA15, CH2/PB3, CH3/PB10 and CH4/PB11
Bit 7: 6	TMR1_MUX	0x0	rw	TMR1 IO multiplexing Select IO multiplexing for TMR1. 00: EXT/PA12, CH1/PA8, CH2/PA9, CH3/PA10, CH4/PA11, BRK/PB12, CH1C/PB13, CH2C/PB14, CH3C/PB15; 01: EXT/PA12, CH1/PA8, CH2/PA9, CH3/PA10, CH4/PA11, BRK/PA6, CH1C/PA7, CH2C/PB0, CH3C/PB1; 10: Unused 11: Unused
Bit 5: 4	USART3_MUX	0x0	rw	USART3 IO multiplexing Select IO multiplexing for USART3. 00: TX/PB10, RX/PB11, CK/PB12, CTS/PB13, RTS/PB14; 01: TX/PC10, RX/PC11, CK/PC12, CTS/PB1, RTS/PB14; 10: Unused 11: Unused
Bit 3	Reserved	0x0	resd	Kept at its default value.
Bit 2	USART1_MUX	0x0	rw	USART1 IO multiplexing Select USART1 IO multiplexing 0: TX/PA9, RX/PA10 1: TX/PB6, RX/PB7
Bit 1	I2C1_MUX	0x0	rw	I2C1 IO multiplexing Select I2C1 IO multiplexing. 0: SCL/PB6, SDA/PB7 SMBA/PB5 1: SCL/PB8, SDA/PB9 SMBA/PB5
Bit 0	SPI1_MUX	0x0	rw	SPI1 IO multiplexing Select SPI1 IO multiplexing. SPI1_MUX[1] is in bit 31. 00: CS/PA4, SCK/PA5, MISO/PA6, MOSI/PA7 MCK/PB0 . 01: CS/PA15, SCK/PB3, MISO/PB4, MOSI/PB5 MCK/PB0; 10, 11: Unused

7.4.3 IOMUX external interrupt configuration register1 (IOMUX_EXINTC1)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 12	EXINT3	0x0000	rw	EXINT3 input source configuration Select the input source for EXINT3 external interrupt. 0000: GPIOA pin3 0001: GPIOB pin3 0010: GPIOC pin3 0011: GPIOD pin3 0100: GPIOF pin3 Others: Reserved.
Bit 11: 8	EXINT2	0x0000	rw	EXINT2 input source configuration Select the input source for EXINT2 external interrupt. 0000: GPIOA pin2 0001: GPIOB pin2 0010: GPIOC pin2 0011: GPIOD pin2 0100: GPIOF pin2 Others: Reserved.
Bit 7: 4	EXINT1	0x0000	rw	EXINT1 input source configuration Select the input source for EXINT1 external interrupt. 0000: GPIOA pin1 0001: GPIOB pin1 0010: GPIOC pin1 0011: GPIOD pin1 0100: GPIOF pin1 Others: Reserved.
Bit 3: 0	EXINT0	0x0000	rw	EXINT0 input source configuration Select the input source for EXINT0 external interrupt. 0000: GPIOA pin0 0001: GPIOB pin0 0010: GPIOC pin0 0011: GPIOD pin0 0100: GPIOF pin0 Others: Reserved.

7.4.4 IOMUX external interrupt configuration register2 (IOMUX_EXINTC2)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 12	EXINT7	0x0000	rw	EXINT7 input source configuration Select the input source for EXINT7 external interrupt. 0000: GPIOA pin7 0001: GPIOB pin7 0010: GPIOC pin7 0011: GPIOD pin7 0100: GPIOF pin7 Others: Reserved.
Bit 11: 8	EXINT6	0x0000	rw	EXINT6 input source configuration Select the input source for EXINT6 external interrupt. 0000: GPIOA pin6 0001: GPIOB pin6 0010: GPIOC pin6 0011: GPIOD pin6 0100: GPIOF pin6 Others: Reserved.
Bit 7: 4	EXINT5	0x0000	rw	EXINT5 input source configuration Select the input source for EXINT5 external interrupt. 0000: GPIOA pin5 0001: GPIOB pin5 0010: GPIOC pin5 0011: GPIOD pin5 0100: GPIOF pin5 Others: Reserved.
Bit 3: 0	EXINT4	0x0000	rw	EXINT4 input source configuration Select the input source for EXINT4 external interrupt. 0000: GPIOA pin4 0001: GPIOB pin4 0010: GPIOC pin4 0011: GPIOD pin4 0100: GPIOF pin4 Others: Reserved.

7.4.5 IOMUX external interrupt configuration register3 (IOMUX_EXINTC3)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 12	EXINT11	0x0000	rw	EXINT11 input source configuration Select the input source for EXINT11 external interrupt. 0000: GPIOA pin11 0001: GPIOB pin11 0010: GPIOC pin11 0011: GPIOD pin11 0100: GPIOF pin11 Others: Reserved.
Bit 11: 8	EXINT10	0x0000	rw	EXINT10 input source configuration Select the input source for EXINT10 external interrupt. 0000: GPIOA pin10

				0001: GPIOB pin10 0010: GPIOC pin10 0011: GPIOD pin10 0100: GPIOF pin10 Others: Reserved.
Bit 7: 4	EXINT9	0x0000	rw	EXINT9 input source configuration Select the input source for EXINT9 external interrupt. 0000: GPIOA pin9 0001: GPIOB pin9 0010: GPIOC pin9 0011: GPIOD pin9 0100: GPIOF pin9 Others: Reserved.
Bit 3: 0	EXINT8	0x0000	rw	EXINT8 input source configuration Select the input source for EXINT8 external interrupt. 0000: GPIOA pin8 0001: GPIOB pin8 0010: GPIOC pin8 0011: GPIOD pin8 0100: GPIOF pin8 Others: Reserved.

7.4.6 IOMUX external interrupt configuration register4 (IOMUX_EXINTC4)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 12	EXINT15	0x0000	rw	EXINT15 input source configuration Select the input source for EXINT15 external interrupt. 0000: GPIOA pin15 0001: GPIOB pin15 0010: GPIOC pin15 0011: GPIOD pin15 0100: GPIOF pin15 Others: Reserved.
Bit 11: 8	EXINT14	0x0000	rw	EXINT14 input source configuration Select the input source for EXINT14 external interrupt. 0000: GPIOA pin14 0001: GPIOB pin14 0010: GPIOC pin14 0011: GPIOD pin14 0100: GPIOF pin14 Others: Reserved.
Bit 7: 4	EXINT13	0x0000	rw	EXINT13 input source configuration Select the input source for EXINT13 external interrupt. 0000: GPIOA pin13 0001: GPIOB pin13 0010: GPIOC pin13 0011: GPIOD pin13 0100: GPIOF pin13 Others: Reserved.
Bit 3: 0	EXINT12	0x0000	rw	EXINT12 input source configuration Select the input source for EXINT12 external interrupt. 0000: GPIOA pin12

				0001: GPIOB pin12 0010: GPIOC pin12 0011: GPIOD pin12 0100: GPIOF pin12 Others: Reserved.

7.4.7 IOMUX remap register2 (IOMUX_REMAP2)

Bit	Register	Reset value	Type	Description
Bit 31: 22	Reserved	0x000	resd	Keep at its default value.
Bit 21	EXT_SPIM_EN _MUX	0x0	rw	SPIM enable Select whether to use SPI Flash.
Bit 20: 0	Reserved	0x00	resd	Kept at its default value.

7.4.8 IOMUX remap register3 (IOMUX_REMAP3)

Bit	Register	Reset value	Type	Description
Bit 31: 12	Reserved	0x0000000	resd	Kept at its default value.
Bit 11: 8	TMR11_GMUX	0x0	rw	TMR11 IO general multiplexing Select IO multiplexing for TMR11. 0000: CH1/PB9 0001: CH1/PA7
Bit 7: 4	TMR10_GMUX	0x0	rw	TMR10 IO general multiplexing Select IO multiplexing for TMR10. 0000: CH1/PB8 0001: CH1/PA6
Bit 3: 0	TMR9_GMUX	0x0	rw	TMR9 IO general multiplexing Select IO multiplexing for TMR9. 0000: CH1/PA2, CH2/PA3 0001: CH1/PB14, CH2/PB15

7.4.9 IOMUX remap register4 (IOMUX_REMAP4)

Bit	Register	Reset value	Type	Description
Bit 31: 20	Reserved	0x000	resd	Kept at its default value.
Bit 19	TMR5CH4_GMUX	0x0	rw	TMR5 channel4 general multiplexing Select TMR5 channel4 general multiplexing 0: TMR5_CH4 is connected to PA3. 1: LICK is connected to TMR5_CH4 to get calibration.
Bit 18: 16	TMR5_GMUX	0x0	rw	TMR5 IO general multiplexing Select IO multiplexing for TMR5. 000:TMR5_CH1 is mapped to PA0, and TMR5_CH2 to PA1 001: TMR5_CH1 is mapped to PF4, and TMR5_CH2 to PF5 010~111: Reserved for other use.
Bit 15: 12	Reserved	0x0	resd	Kept at its default value.
Bit 11: 8	TMR3_GMUX	0x0	rw	TMR3 IO general multiplexing Select IO multiplexing for TMR3. 0000: CH1/PA6 CH2/PA7 CH3/PB0 CH4/PB1 0010: CH1/PB4 CH2/PB5 CH3/PB0 CH4/PB1 0011: CH1/PC6 CH2/PC7 CH3/PC8 CH4/PC9
Bit 7:	TMR2ITR1_GMUX	0x0	rw	TMR2 internal trigger 1 general multiplexing Select TMR2_ITR1 general multiplexing 0: TMR8_TRGO is used as input source of TMR2 ITR1 1: USB SOF is used as input source of TMR2_ITR1 (This selection will cause TMR2_GMUX/TMR2_MUX failure. Pay more attention to this restriction)

Bit 6: 4	TMR2_GMUX	0x0	rw	TMR2 IO general multiplexing Select IO multiplexing for TMR2. 000: CH1_EXT/PA0 CH2/PA1 CH3/PA2 CH4/PA3 001: CH1_EXT/PA15 CH2/PB3 CH3/PA2 CH4/PA3 010: CH1_EXT/PA0 CH2/PA1 CH3/PB10 CH4/PB11 011: CH1_EXT/PA15 CH2/PB3 CH3/PB10 CH4/PB11 111~111: Reserved for other use.
Bit 3: 0	TMR1_GMUX	0x0	rw	TMR1 IO general multiplexing Select IO multiplexing for TMR1. 0000: EXT/PA12, CH1/PA8, CH2/PA9, CH3/PA10, CH4/PA11, BRK/PB12, CH1C/PB13, CH2C/PB14, CH3C/PB15; 0001: EXT/PA12, CH1/PA8, CH2/PA9, CH3/PA10, CH4/PA11, BRK/PA6, CH1C/PA7, CH2C/PB0, CH3C/PB1; Others: Unused.

7.4.10 IOMUX remap register5 (IOMUX_REMAP5)

Bit	Register	Reset value	Type	Description
Bit 31: 24	Reserved	0x0	resd	Kept at its default value.
Bit 23: 20	SPI2_GMUX	0x0	rw	SPI2 IO general multiplexed function Select IO multiplexing for SPI2. 0000: CS/PB12, SCK/PB13, MISO/PB14, MOSI/PB15 MCK/PB0 . 0001: CS/PA15, SCK/PB3, MISO/PB4, MOSI/PB5 MCK/PC7 Others: Unused.
Bit 19: 16	SPI1_GMUX	0x0	rw	SPI1 IO general multiplexed function Select IO multiplexing for SPI1. 0000: CS/PA4, SCK/PA5, MISO/PA6, MOSI/PA7 MCK/PB0 . 0001: CS/PA15, SCK/PB3, MISO/PB4, MOSI/PB5 MCK/PB6。 Others: Unused.
Bit 15: 12	Reserved	0x0	resd	Kept at its default value.
Bit 11: 8	I2C2_GMUX	0x0	rw	I2C2 IO general multiplexed function Select IO multiplexing for I2C1. 0000: SCL/PB10, SDA/PB11 SMBA/PB12; 0001: SCL/PF6, SDA/PF7 SMBA/PA9; 0010: SCL/PA8, SDA/PC9 SMBA/PA9; 0011: SCL/PA8, SDA/PB4 SMBA/PA9; Others: Unused.
Bit 3: 0	Reserved	0x0	resd	Kept at its default value.

7.4.11 IOMUX remap register6 (IOMUX_REMAP6)

Bit	Register	Reset value	Type	Description
Bit 31: 28	UART4_GMUX	0x0	rw	IO general multiplexing Select IO multiplexing for UART4. 0000: TX/PC10 RX/PC11 0001: TX/PF4 RX/PF5 Others: Unused
Bit 27: 24	USART3_GMUX	0x0	rw	USART3 IO general multiplexing Select IO multiplexing for USART3. 0000: TX/PB10, RX/PB11, CK/PB12, CTS/PB13, RTS/PB14 0001: TX/PC10, RX/PC11, CK/PC12, CTS/PB13,

				RTS/PB14 Others: Unused
Bit 23: 20	Reserved	0x0	resd	Kept at its default value.
Bit 19: 16	USART1_GMUX	0x0	rw	USART1 IO general multiplexing Select IO multiplexing for USART1. 0000: TX/PA9, RX/PA10 0001: TX/PB6, RX/PB7 Others: Unused
Bit 15:12	Reserved	0x0	resd	Kept at its default value.
Bit 11:8	SDIO1_GMUX	0x0	rw	SDIO1 IO general multiplexing Select IO multiplexing for SDIO1. 0000: D0/PC8 D1/PC9 D2/PC10 D3/PC11 D4/PB8 D5/PB9 D6/PC6 D7/PC7 CK/PC12 CMD/PD2 0100: D0/PC0 D1/PC1 D2/PC2 D3/PC3 D4/PA4 D5/PA5 D6/PA6 D7/PA7 CK/PC4 CMD/PC5 0101: D0/PA4 D1/PA5 D2/PA6 D3/PA7 CK/PC4 CMD/PC5 0110: D0/PC0 D1/PC1 D2/PC2 D3/PC3 D4/PA4 D5/PA5 D6/PA6 D7/PA7 CK/PA2 CMD/PA3 0111: D0/PA4 D1/PA5 D2/PA6 D3/PA7 CK/PA2 CMD/PA3 Others: Unused
Bit 7: 4	CAN2_GMUX	0x0	rw	CAN2 IO general multiplexing Select IO multiplexing for CAN2. 0000: RX/PB12, TX/PB13 0001: RX/PB5, TX/PB6 Others: Unused
Bit 3: 0	CAN1_GMUX	0x0	rw	CAN1 IO general multiplexing Select IO multiplexing for CAN1. 00:RX/PA11,TX/PA12 01: Unused 10: RX/ PB8,TX/ PB9 11: Unused

7.4.12 IOMUX remap register7 (IOMUX_REMAP7)

Bit	Register	Reset value	Type	Description
Bit 31: 21	Reserved	0x0	resd	Kept at its default value.
Bit 20	PD01_GMUX	0x0	rw	PD0/PD1 mapped onto HEXT_IN / HEXT_OUT Select GPIO mapping for PD0 and PD1. This is applied to only 48-pin and 64-pin packages. 0: No PD0 and PD1 mapping 1: PD0 is mapped to HEXT_IN, while PD1 is mapped to HEXT_OUT.
Bit 19	Reserved	0x0	resd	Kept at its default value.
Bit 18: 16	SWJTAG_GMUX	0x0	rw	SWD JTAG IO general mutiplexing These bits are used to configure SWJTAG-related IOs as GPIO. 000: Supports SWD and JTAG. All SWJTAG pins cannot be used as GPIO. 001: Supports SWD and JTAG. NJTRST is disabled. PB4 can be used as GPIO. 010: Supports SWD. But JTAG is disabled. PA15/PB3/PB4 can be used as GPIO. 100: SWD and JTAG are disabled. All SWJTAG pins canbe used as GPIO

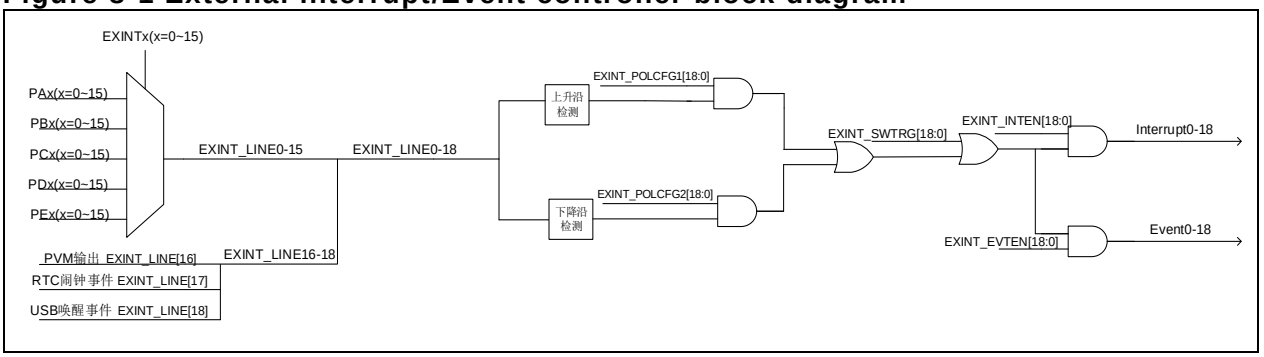
				Others: No effect.
Bit 15: 10	Reserved	0x00	resd	Kept at its default value.
Bit 9	ADC2_ETO_GMUX	0x0	rw	ADC2 external trigger regular conversion general multiplexing Select the input source for ADC2 external trigger regular conversion 0: ADC2 external trigger regular conversion is connected to EXINT11 1: ADC2 external trigger regular conversion is connected to TMR8_TRGO.
Bit 8	ADC2_ETP_GMUX	0x0	rw	ADC2 external trigger preempted conversion general multiplexing Select the input source for ADC2 external trigger preempted conversion 0: ADC2 external trigger preempted conversion is connected to EXINT15 1: ADC2 external trigger preempted conversion is connected to TMR8 channel 4
Bit 7: 6	Reserved	0x0	resd	Keep at its default value.
Bit 5	ADC1_ETO_GMUX	0x0	rw	ADC1 external trigger regular conversion general multiplexing Select the input source for ADC1 external trigger regular conversion. 0: ADC1 external trigger regular conversion is connected to EXINT11 1: ADC1 external trigger regular conversion is connected to TMR8_TRGO
Bit 4	ADC1_ETP_GMUX	0x0	rw	ADC1 External trigger preempted conversion general multiplexing Select the input source for ADC1 External trigger preempted conversion. 0: ADC1 External trigger preempted conversion is connected to EXINT15 1: ADC1 External trigger preempted conversion is connected to TMR8 channel 4
Bit 3	EXT_SPIM_GEN	0x0	rw	SPIM enable Select whether to use SPI Flash.
Bit 2: 0	EXT_SPIM_GMUX	0x0	rw	Select IO multiplexing for SPIM 000: SCK/PB1 CS/PA8 IO0/PA11 IO1/PA12 IO2/PB7 IO3/PB6 001: SCK/PB1 CS/PA8 IO0/PB10 IO1/PB11 IO2/PB7 IO3/PB6 Others: Unused

8 External interrupt/Event controller (EXINT)

8.1 EXINT introduction

EXINT consists of 19 interrupt lines EXINT_LINE[18:0], each of which can generate an interrupt or event by edge detection trigger or software trigger. EXINT can enable or disable an interrupt or event independenttly through software configuration, and utilizes different edge detection modes (rising edge, falling edge or both edges) as well as trigger modes (edge detection, software trigger or both tirggers) to respond to the trigger source in order to generate an interrupt or event.

Figure 8-1 External interrupt/Event controller block diagram



Main features:

- EXINT 0~15 mapping IO can be configured independently
- Independent trigger selection on each interrupt line
- Independent enable bit on each interrupt
- Independent enable bit on each event
- Up to 19 software trigger that can be generated and cleared independently.
- Independent status bit on each interrupt
- Each interrupt can be cleared independently.

8.2 Function overview and configuration procedure

With up to 19 interrupt lines EXINT_LINE[18:0], EXINT can detect not only GPIO external interrupt sources but also internal sources such as PVM output, RTC alarm events and USB wakeup events through edge detection mechanism, where, GPIO interrupt sources can be selected with IOMUX_EXINTCx register. It should be noted that these input sources are mutually exclusive. For example, EXINT_LINE0 is allowed to select only one of PA0/PB0/PC0/PD0 pins, instead of taking both PA0 and PB0 as the input sources at the same time.

EXINT supports several edge detection modes, including rising edge, falling edge or both edges, selected by EXINT_POLCFG1 and EXINT_POLCFG2 register. Active edge trigger detected on the interrupt line can be used to generate an events or interrupt.

In addition, EXINT supports independent software trigger for the generation of an event or interrupt. This is achieved by setting the corresponding bits in the EXINT_SWTRG register.

EXINT can enable or disable an interrupt or event independently through software configuration such as EXINT_INTEN and EXINT_EVTEN register, indicating that the corresponding interrupt or event must be enabled prior to either edge detection or software trigger.

EXINT also features an independent interrupt status bit. Reading access to EXINT_INTSTS register can obtain the corresponding interrupt status. The status flag is cleared by writing “1” to this register.

Interrupt initialization procedure

1. Select an interrupt source by setting SCFG_EXINTCx register (This is required if GPIO is used as an interrupt source)
2. Select an trigger mode by setting EXINT_POLCFG1 and EXINT_POLCFG2 register
3. Enable interrupt or event by setting EXINT_INTEN and EXINT_EVTEN register

4. Generate software trigger by setting EXINT_SWTRG register (This is applied to software trigger interrupt only)

Note: if there is a need to modify interrupt source configuration, then switch off interrupt enable register and event enable register first before re-starting interrupt initialization configuration.

Interrupt clear procedure

- Writing “1” to the EXINT_INTSTS register to clear the interrupts generated, and the corresponding bits in the EXINT_SWTRG register.

8.3 EXINT registers

These peripheral registers must be accessed by words (32 bits).

Table 8-1 shows EXINT register map and their reset value.

Table 8-1 External interrupt/Event controller register map and reset value

Register	Offset	Reset value
EXINT_INTEN	0x00	0x0000 0000
EXINT_EVTEN	0x04	0x0000 0000
EXINT_ POLCFG1	0x08	0x0000 0000
EXINT_ POLCFG2	0x0C	0x0000 0000
EXINT_ SWTRG	0x10	0x0000 0000
EXINT_ INTSTS	0x14	0x0000 0000

8.3.1 Interrupt enable register (EXINT_INTEN)

Bit	Register	Reset value	Type	Description
Bit 31: 19	Reserved	0x000	resd	Forced to 0 by hardware.
Bit 18: 0	INTENx	0x00000	rw	Interrupt enable or disable on line x 0: Interrupt request is disabled. 1: Interrupt request is enabled..

8.3.2 Event enable register (EXINT_EVTEN)

Bit	Register	Reset value	Type	Description
Bit 31: 19	Reserved	0x000	resd	Forced to 0 by hardware.
Bit 18: 0	EVTENx	0x00000	rw	Event enable or disable on line x 0: Event request is disabled. 1: Event request is enabled.

8.3.3 Polarity configuration register1 (EXINT_ POLCFG1)

Bit	Register	Reset value	Type	Description
Bit 31: 19	Reserved	0x000	resd	Forced to 0 by hardware.
Bit 18: 0	RPx	0x00000	rw	Rising edge event configuration bit on line x These bits are used to select rising edge to trigger an interrupt and event on line x. 0: Rising trigger on line x is disabled. 1: Rising trigger on line x is enable.

8.3.4 Polarity configuration register2 (EXINT_ POLCFG2)

Bit	Register	Reset value	Type	Description
Bit 31: 19	Reserved	0x000	resd	Forced to 0 by hardware.
Bit 18: 0	FPx	0x00000	rw	Falling edge event configuration bit on line x These bits are used to select falling edge to trigger an interrupt and event on line x. 0: Falling trigger on line x is disabled. 1: Falling trigger on line x is enabled.

8.3.5 Software trigger register (EXINT_ SWTRG)

Bit	Register	Reset value	Type	Description
Bit 31: 19	Reserved	0x000	resd	Forced to 0 by hardware.
Bit 18: 0	SWTx	0x00000	rw	Software triggle on line x If the corresponding bit in EXINT_INTEN register is 1, the software writes to this bit. The hardware sets the corresponding bit in the EXINT_INTSTS automatically to generate an interrupt. If the corresponding bit in the EXINT_EVTEN register is 1, the software writes to this bit. The hardward generates an event on the corresponding interrupt line automatically. 0: Default value 1: Sotware trigger generated Note: This bit is cleared by writing 1 to the corresponding bit in the EXINT_INTSTS register.

8.3.6 Interrupt status register (EXINT_ INTSTS)

Bit	Register	Reset value	Type	Description
Bit 31: 19	Reserved	0x000	resd	Forced to 0 by hardware.
Bit 18: 0	LINEx	0x00000	rw	Line x status bit 0: No interrupt occurred. 1: Interrupt occurred. Note: This bit is cleared by writing 1.

9 DMA controller (DMA)

9.1 Introduction

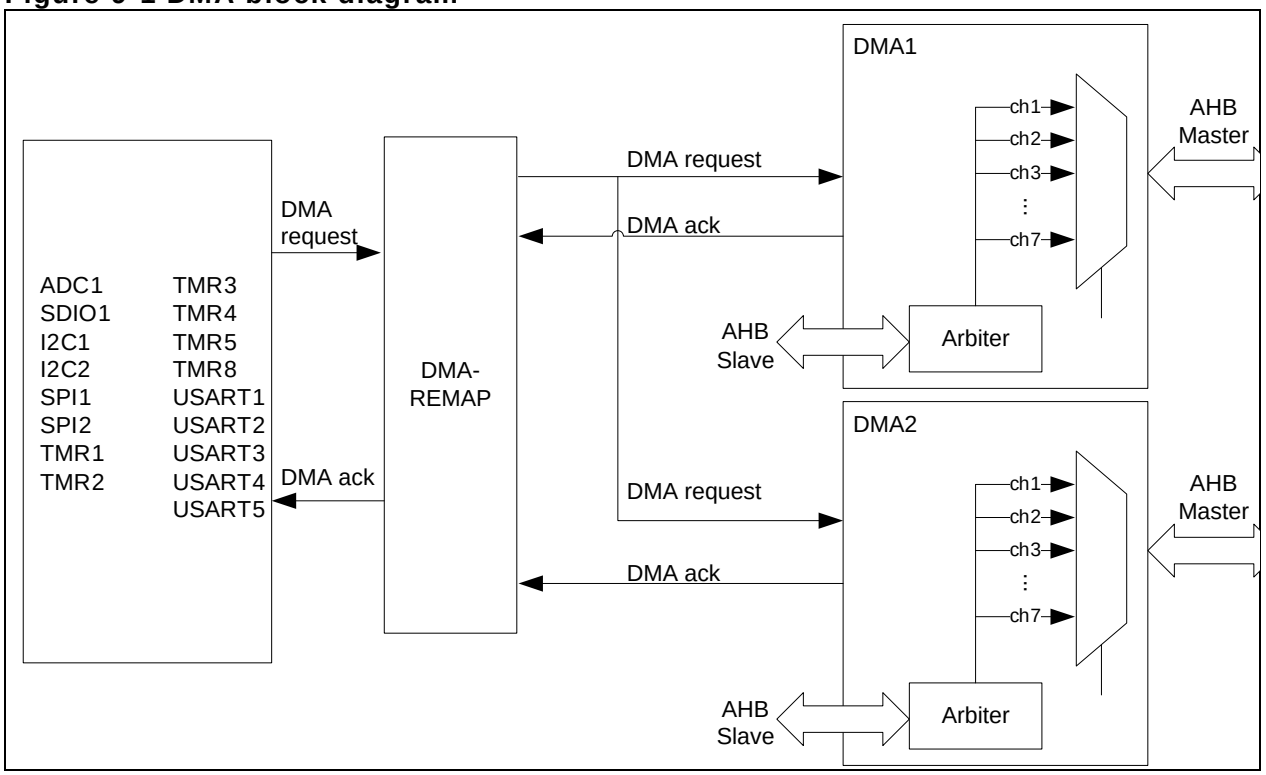
Direct memory access (DMA) controller is designed for 32-bit MCU applications with the aim of enhancing system performance and reducing the generation of interrupts.

There are two DMA controllers in the microcontroller. Each controller contains 7 DMA channels. Each channel manages memory access requests from one or more peripherals. An arbiter is available for coordinating the priority of DMA requests.

9.2 Main features

- AMBA compliant (Rev. 2.0)
- Only support AHB OKAY and ERROR responses
- HBUSREQ and HGRANT of AHB master interface are not supported
- Support 7 channels
- Peripheral-to-memory, memory-to-peripheral, and memory-to-memory transfers
- Support hardware handshake
- Support 8-bit, 16-bit and 32- bit data transfers
- Programmable amount of data to be transferered: up to 65535
- Support flexible mapping

Figure 9-1 DMA block diagram



Note: The number of DMA peripherals in Figure 9-1 may decrease depending on different models.

9.3 Function overview

9.3.1 DMA configuration

1. **Set the peripheral address in the DMA_CxPADDR register**
   The initial peripheral address for data transfer remains unchanged during transmission.
2. **Set the memory address in the DMA_CxMADDR register**
   The initial memory address for data transfer remains unchanged during transmission.
3. **Configure the amount of data to be transferred in the DMA_CxDTCNT register**
   Programmable data transfer size is up to 65535. This value is decremented after each data transfer.
4. **Configure the channel setting in the DMA_CxCTRL register**
   Including channel priority, data transfer direction/width, address incremented mode, circular mode and interrupt mode

- **Channel priority (CHPL)**

There are four levels, including very high priority, high priority, medium priority and low priority.
If the two channels have the same priority level, then the channel with lower number will get priority over the one with higher number. For example, channel 1 has priority over channel 2.

- **Data transfer direction (DTD)**

Memory-to-peripheral (M2P), peripheral-to-memory (P2M)

- **Address incremented mode (PINCM/MINCM)**

In incremented mode, the subsequent transfer address is the previous address plus transfer width (PWIDTH/MWIDTH).

- **Circular mode (LM)**

In circular mode, the contents in the DMA_CxDTCNT register is automatically reloaded with the initially programmed value after the completion of the last transfer.

- **Memory-to-memory mode (M2M)**

This mode indicates that DMA channels perform data transfer without requests from peripherals. Circular mode and memory-to-memory mode cannot be used at the same time.

5. **Enable DMA transfer by setting the CHEN bit in the DMA_CxCTRL register**

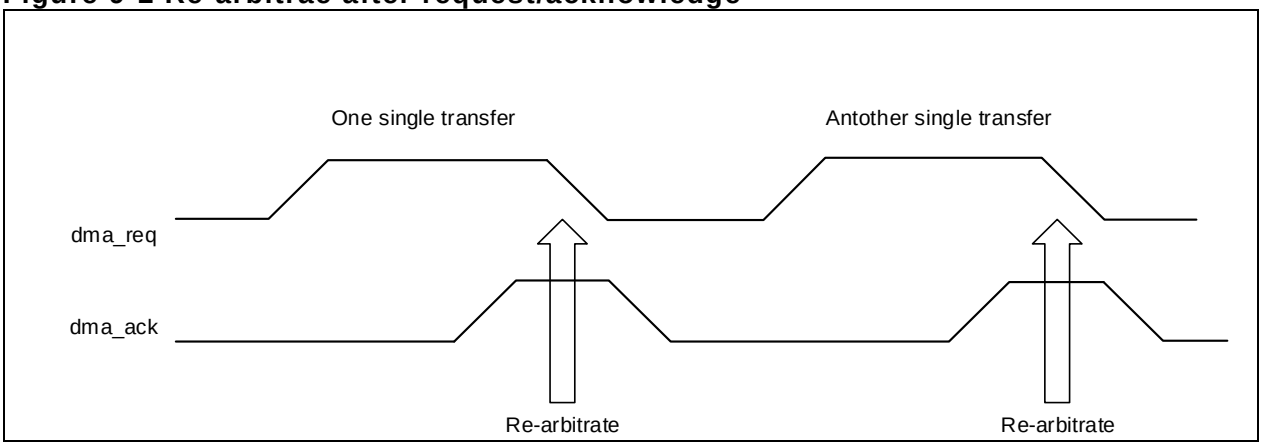
9.3.2 Handshake mechanism

In P2M and M2P mode, the peripherals need to send a request signal to the DMA controller. The DMA channel will send the peripheral transfer request (single) until the signal is acknowledged. After the completion of peripheral transmission, the DMA controller sends the acknowledge signal to the peripheral. The peripheral then releases its request as soon as it receives the acknowledge signal. At the same time, the DMA controller releases the acknowledge signal as well.

9.3.3 Arbiter

When several channels are enabled simultaneously, the arbiter will restart arbitration after full data transfer by the master controller. The channel with very high priority waits until the channel of the master controller has completed data transfers before taking control of it. The master controller will re-arbitrate to serve other channels as long as the channel completes a single transfer based on the master controller priority.

Figure 9-2 Re-arbitrae after request/acknowledge



9.3.4 Programmable data transfer width

Transfer width of the source data and destination data is programmable through the PWIDTH and MWIDTH bits in the DMA_CxCTRL register. When PWIDTH is not equal to MWIDTH, it can be aligned according to the settings of PWIDTH/ MWIDTH.

Figure 9-3 PWIDTH: byte, MWIDTH: half-word

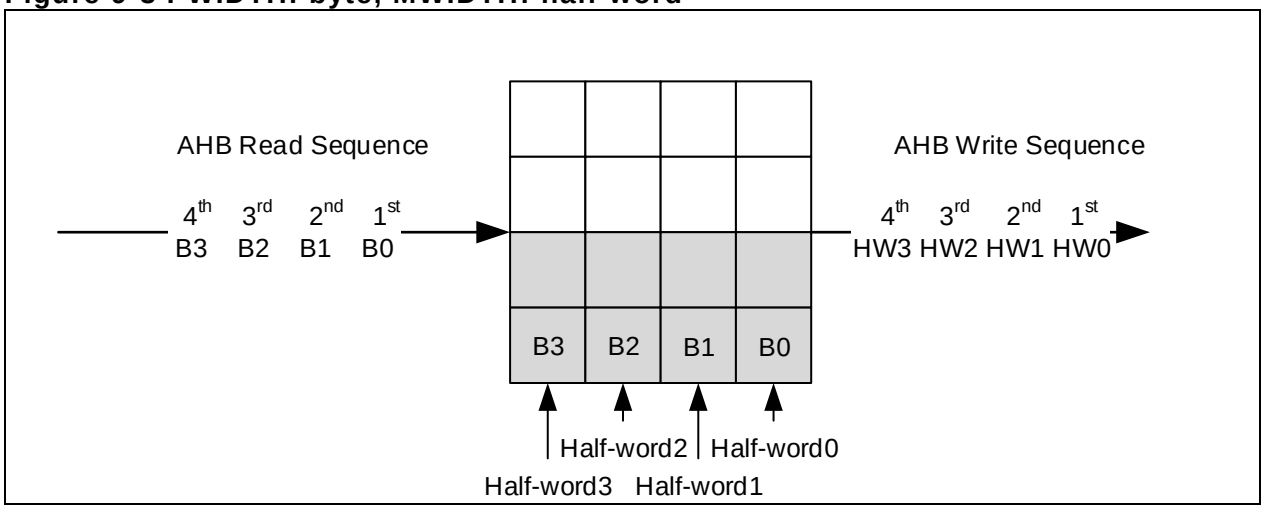


Figure 9-4 PWIDTH: half-word, MWIDTH: word

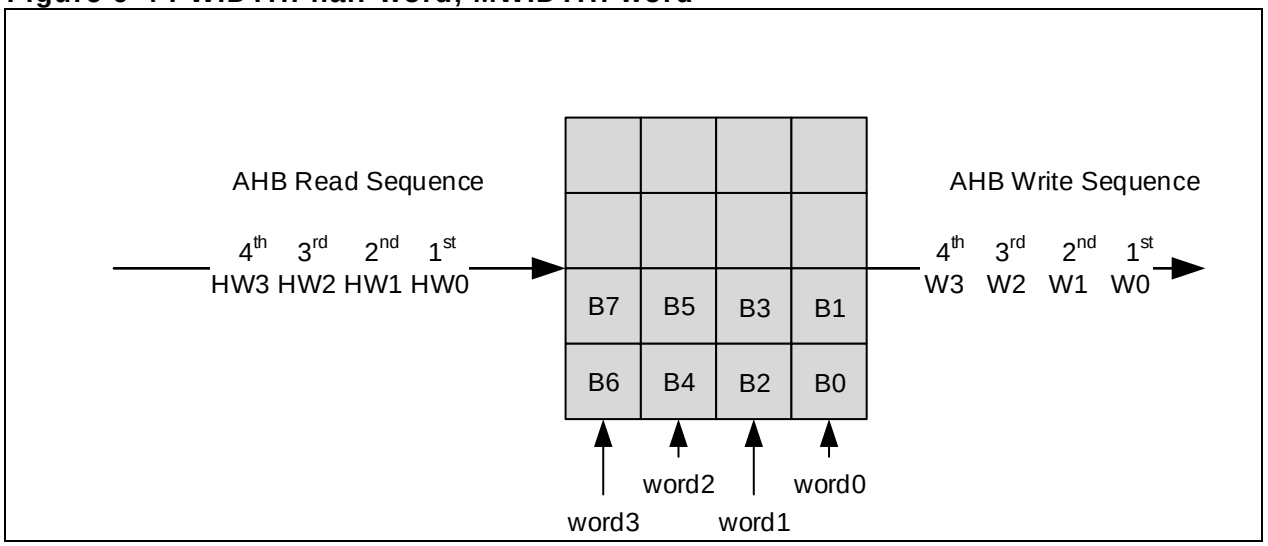

Figure 9-5 PWIDTH: word, MWIDTH: byte

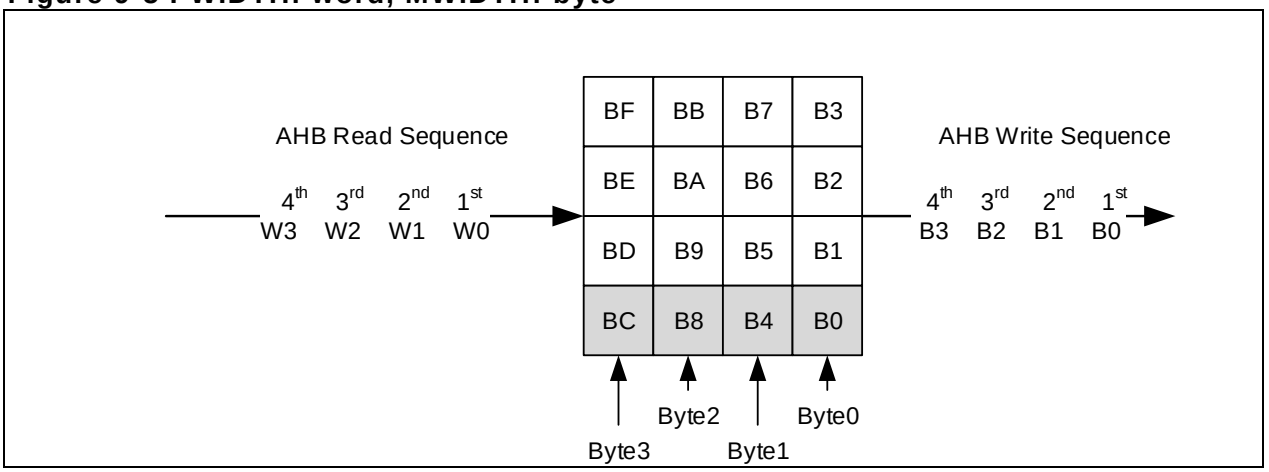

9.3.5 Error events

Table 9-1 DMA error event

Error event	
Transfer error	AHB response error occurred during DMA read/write access

9.3.6 Interrupts

An interrupt can be generated on a DMA half-transfer, transfer complete and transfer error. Each channel has its specific interrupt flag, clear and enable bits, as shown in the table below.

Table 9-2 DMA interrupt requests

Interrupt event	Event flag bit	Clear control bit	Enable control bit
Half transfer	HDTF	HDTFC	HDTIEN
Transfer completed	FDTF	FDTFC	FDTIEN
Transfer error	DTERRF	DTERRFC	DTERRIEN

Note: DMA 2 channel 4/channel 5, channel 6/channel 7 interrupts are mapped onto the same interrupt vector.

9.3.7 Fixed DMA request mapping

Several peripheral requests are mapped to the same DMA channel through logic ORed. This means that only one peripheral request can be enabled on one channel at a time.

The peripheral DMA requests can be independently activated/de-activated by setting the control bits in the corresponding peripheral registers.

Table 9-3 DMA1 requests for each channel

Peripherals	Channel 1	Channel 2	Channel 3	Channel 4	Channel 5	Channel 6	Channel 7
ADC1	ADC1

9.3.8 Flexible DMA request mapping

In flexible request mapping mode (DMA_FLEX_EN = 1), the request source of each channel is programmed by CHx_SRC [x=1, 2, 3, 4, 5, 6, 7].

The table below shows CHx_SRC values and their corresponding request sources.

Table 9-5 Flexible DMA requests for each channel

DMAMUX request	Source	DMAMUX request	Source	DMAMUX request	Source	DMAMUX Source	Source
1	reserved	33	UART5_RX	65	TMR2_CH2	97	reserved
2	ADC1	34	UART5_TX	66	TMR2_CH3	98	reserved

Register	Offset	Reset value
DMA_C7CTRL	0x80	0x0000 0000
DMA_C7DTCNT	0x84	0x0000 0000
DMA_C7PADDR	0x88	0x0000 0000
DMA_C7MADDR	0x8C	0x0000 0000
DMA_SRC_SEL0	0xA0	0x0000 0000
DMA_SRC_SEL1	0xA4	0x0000 0000

Note: In the following registers, all bits related to channel 6 and channel 7 are not relevant for DMA 2 fixed request mapping since it has only 5 channels.

9.4.1 DMA interrupt status register (DMA_STS)

Accessible: no-wait state, byte, half-word and word.

Bit	Register	Reset value	Type	Description
31: 28	Reserved	0x0	resd	Kept at its default value.
Bit 27	DTERRF7	0x0	ro	Channel 7 data transfer error event flag 0: No transfer error occurred. 1: Transfer error occurred.
Bit 26	HDTF7	0x0	ro	Channel half transfer event flag 0: No half-transfer event occurred. 1: Half-transfer event occurred.
Bit 25	FDTF7	0x0	ro	Channel 7 transfer complete event flag 0: No transfer complete event occurred. 1: Transfer complete event occurred.
Bit 24	GF7	0x0	ro	Channel global event flag 0: No transfer error, half transfer or transfer complete event occurred. 1: Transfer error, half transfer or transfer complete event occurred.
Bit 23	DTERRF6	0x0	ro	Channel 6 data transfer error event flag 0: No transfer error occurred. 1: Transfer error occurred.
Bit 22	HDTF6	0x0	ro	Channel 6 half transfer event flag 0: No half-transfer event occurred. 1: Half-transfer event occurred.
Bit 21	FDTF6	0x0	ro	Channel 6 transfer complete event flag 0: No transfer complete event occurred. 1: Transfer complete event occurred.
Bit 20	GF6	0x0	ro	Channel 6 global event flag 0: No transfer error, half transfer or transfer complete event occurred. 1: Transfer error, half transfer or transfer complete event
Bit 19	DTERRF5	0x0	ro	Channel 5 data transfer error event flag 0: No transfer error occurred. 1: Transfer error occurred.
Bit 18	HDTF5	0x0	ro	Channel 5 half transfer event flag 0: No half-transfer event occurred. 1: Half-transfer event occurred.
Bit 17	FDTF5	0x0	ro	Channel 5 transfer complete event flag 0: No transfer complete event occurred. 1: Transfer complete event occurred.

Bit 16	GF5	0x0	ro	Channel 5 global event flag 0: No transfer error, half transfer or transfer complete event occurred. 1: Transfer error, half transfer or transfer complete event
Bit 15	DTERRF4	0x0	ro	Channel 4 data transfer error event flag 0: No transfer error occurred. 1: Transfer error occurred.
Bit 14	HDTF4	0x0	ro	Channel 4 half transfer event flag 0: No half-transfer event occurred. 1: Half-transfer event occurred.
Bit 13	FDTF4	0x0	ro	Channel 4 transfer complete event flag 0: No transfer complete event occurred. 1: Transfer complete event occurred.
Bit 12	GF4	0x0	ro	Channel 4 global event flag 0: No transfer error, half transfer or transfer complete event occurred. 1: Transfer error, half transfer or transfer complete event
Bit 11	DTERRF3	0x0	ro	Channel 3 data transfer error event flag 0: No transfer error occurred. 1: Transfer error occurred.
Bit 10	HDTF3	0x0	ro	Channel 3 half transfer event flag 0: No half-transfer event occurred. 1: Half-transfer event occurred.
Bit 9	FDTF3	0x0	ro	Channel 3 transfer complete event flag 0: No transfer complete event occurred. 1: Transfer complete event occurred.
Bit 8	GF3	0x0	ro	Channel 3 global event flag 0: No transfer error, half transfer or transfer complete event occurred. 1: Transfer error, half transfer or transfer complete event
Bit 7	DTERRF2	0x0	ro	Channel 2 data transfer error event flag 0: No transfer error occurred. 1: Transfer error occurred.
Bit 6	HDTF2	0x0	ro	Channel 2 half transfer event flag 0: No half-transfer event occurred. 1: Half-transfer event occurred.
Bit 5	FDTF2	0x0	ro	Channel 2 transfer complete event flag 0: No transfer complete event occurred. 1: Transfer complete event occurred.
Bit 4	GF2	0x0	ro	Channel 2 global event flag 0: No transfer error, half transfer or transfer complete event occurred. 1: Transfer error, half transfer or transfer complete event
Bit 3	DTERRF1	0x0	ro	Channel 1 data transfer error event flag 0: No transfer error occurred. 1: Transfer error occurred.
Bit 2	HDTF1	0x0	ro	Channel 1 half transfer event flag 0: No half-transfer event occurred. 1: Half-transfer event occurred.
Bit 1	FDTF1	0x0	ro	Channel 1 transfer complete event flag 0: No transfer complete event occurred. 1: Transfer complete event occurred.

Bit 0	GF1	0x0	ro	Channel 1 global event flag 0: No transfer error, half transfer or transfer complete event occurred. 1: Transfer error, half transfer or transfer complete event

9.4.2 DMA interrupt flag clear register (DMA_CLR)

Accessible: no-wait state, byte, half-word and word.

Bit	Register	Reset value	Type	Description
31: 28	Reserved	0x0	resd	Kept at its default value.
Bit 27	DTERRFC7	0x0	rw1c	Channel 7 data transfer error flag clear 0: No effect 1: Clear the DTERRF flag in the DMA_STS register
Bit 26	HDTFC7	0x0	rw1c	Channel 7 half transfer flag clear 0: No effect 1: Clear the HDTF7 flag in the DMA_STS register
Bit 25	FDTFC7	0x0	rw1c	Channel 7 transfer complete flag clear 0: No effect 1: Clear the FDTF7 flag in the DMA_STS register
Bit 24	GFC7	0x0	rw1c	Channel 7 global interrupt flag clear 0: No effect 1: Clear the DTERRF7, HDTF7, FDTF7 and GF7 flag in the DMA_STS register
Bit 23	DTERRFC6	0x0	rw1c	Channel 6 data transfer error flag clear 0: No effect 1: Clear the DTERRF6 flag in the DMA_STS register
Bit 22	HDTFC6	0x0	rw1c	Channel 6 half transfer flag clear 0: No effect 1: Clear the HDTF6 flag in the DMA_STS register
Bit 21	FDTFC6	0x0	rw1c	Channel 6 transfer complete flag clear 0: No effect 1: Clear the FDTF6 flag in the DMA_STS register
Bit 20	GFC6	0x0	rw1c	Channel 6 global interrupt flag clear 0: No effect 1: Clear the DTERRF6, HDTF6, FDTF6 and GF6 flag in the DMA_STS register
Bit 19	DTERRFC5	0x0	rw1c	Channel 5 data transfer error flag clear 0: No effect 1: Clear the DTERRF5 flag in the DMA_STS register
Bit 18	HDTFC5	0x0	rw1c	Channel 5 half transfer flag clear 0: No effect 1: Clear the HDTF5 flag in the DMA_STS register
Bit 17	FDTFC5	0x0	rw1c	Channel 5 transfer complete flag clear 0: No effect 1: Clear the FDTF5 flag in the DMA_STS register
Bit 16	GFC5	0x0	rw1c	Channel 5 global interrupt flag clear 0: No effect 1: Clear the DTERRF5, HDTF5, FDTF5 and GF5 in the DMA_STS register
Bit 15	DTERRFC4	0x0	rw1c	Channel 4 data transfer error flag clear 0: No effect 1: Clear the DTERRF4 flag in the DMA_STS register
Bit 14	HDTFC4	0x0	rw1c	Channel 4 half transfer flag lear 0: No effect 1: Clear the HDTF4 flag in the DMA_STS register

Bit 13	FDTFC4	0x0	rw1c	Channel 4 transfer complete flag clear 0: No effect 1: Clear the FDTF4 flag in the DMA_STS register
Bit 12	GFC4	0x0	rw1c	Channel 4 global interrupt flag clear 0: No effect 1: Clear the DTERRF4, HDTF4, FDTF4 and GF4 flag in the DMA_STS register
Bit 11	DTERRFC3	0x0	rw1c	Channel 7 data transfer error flag clear 0: No effect 1: Clear the DTERRF7 flag in the DMA_STS register
Bit 10	HDTFC3	0x0	rw1c	Channel 7 half transfer flag clear 0: No effect 1: Clear the HDTF7 flag in the DMA_STS register
Bit 9	FDTFC3	0x0	rw1c	Channel 3 transfer complete flag clear 0: No effect 1: Clear the FDTF3 flag in the DMA_STS register
Bit 8	GFC3	0x0	rw1c	Channel 3 global interrupt flag clear 0: No effect 1: Clear the DTERRF3, HDTF3, FDTF3 and GF3 flag in the DMA_STS register
Bit 7	DTERRFC2	0x0	rw1c	Channel 2 data transfer error flag clear 0: No effect 1: Clear the DTERRF2 flag in the DMA_STS register
Bit 6	HDTFC2	0x0	rw1c	Channel 2 half transfer flag clear 0: No effect 1: Clear the HDTF2 flag in the DMA_STS register
Bit 5	FDTFC2	0x0	rw1c	Channel 2 transfer complete flag clear 0: No effect 1: Clear the FDTF2 flag in the DMA_STS register
Bit 4	GFC2	0x0	rw1c	Channel 2 global interrupt flag clear 0: No effect 1: Clear the DTERRF2, HDTF2, FDTF2 and GF2 in the DMA_STS register
Bit 3	DTERRFC1	0x0	rw1c	Channel 1 data transfer error flag clear 0: No effect 1: Clear the DTERRF1 flag in the DMA_STS register
Bit 2	HDTFC1	0x0	rw1c	Channel 1 half transfer flag clear 0: No effect 1: Clear the HDTF1 flag in the DMA_STS register
Bit 1	FDTFC1	0x0	rw1c	Channel 1 transfer complete flag clear 0: No effect 1: Clear the FDTF1 flag in the DMA_STS register
Bit 0	GFC1	0x0	rw1c	Channel 1 global interrupt flag clear 0: No effect 1: Clear the DTERRF1, HDTF1, FDTF1 and GF1 in the DMA_STS register

9.4.3 DMA channelx configuration register (DMA_CxCTRL) (x = 1…7)

Accessible: no-wait state, byte, half-word and word.

Bit	Register	Reset value	Type	Description
Bit 31: 15	Reserved	0x00000	resd	Kept at its default value.
Bit 14	M2M	0x0	rw	Memory to memory mode 0: Disabled 1: Enabled.
Bit 13: 12	CHPL	0x0	rw	Channel priority level 00: Low 01: Medium 10: High 11: Very high
Bit 11: 10	MWIDTH	0x0	rw	Memory data bit width 00: 8 bits 01: 16 bits 10: 32 bits 11: Reserved
Bit 9: 8	PWIDTH	0x0	rw	Peripheral data bit width 00: 8 bits 01: 16 bits 10: 32 bits 1: Reserved
Bit 7	MINCM	0x0	rw	Memory address increment mode 0: Disabled 1: Enabled.
Bit 6	PINCM	0x0	rw	Peripheral address increment mode 0: Disabled 1: Enabled.
Bit 5	LM	0x0	rw	Circular mode 0: Disabled 1: Enabled.
Bit 4	DTD	0x0	rw	Data transfer direction 0: Read from peripherals 1: Read from memory
Bit 3	DTERRIEN	0x0	rw	Data transfer error interrupt enable 0: Disabled 1: Enabled.
Bit 2	HDTIEN	0x0	rw	Half-transfer interrupt enable 0: Disabled 1: Enabled.
Bit 1	FDTIEN	0x0	rw	Transfer complete interrupt enable 0: Disabled 1: Enabled.
Bit 0	CHEN	0x0	rw	Channel enable 0: Disabled 1: Enabled.

9.4.4 DMA channelx number of data register (DMA_CxDTCNT) (x = 1…7)

Accessible: no-wait state, byte, half-word and word.

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 0	CNT	0x0000	rw	Number of data to transfer The number of data to transfer is from 0x0 to 0xFFFF. This register can only written when the CHEN bit in the correspoinding channel is set 0. The value is decremented after each DMA transfer. Note: This register holds the number of data to transfer, instead of transfer size. The transfer size is calculated by data width.

9.4.5 DMA channelx peripheral address register (DMA_CxPADDR) (x = 1…7)

Accessible: no-wait state, byte, half-word and word.

Bit	Register	Reset value	Type	Description
Bit 31: 0	PADDR	0x0000 0000	rw	Peripheral base address Base address of peripheral data register is the source or destination of data transfer. Note: The register can only be written when the CHEN bit in the corresponding channel is set 0.

9.4.6 DMA channelx memory address register (DMA_CxMADDR) (x = 1…7)

Accessible: no-wait state, byte, half-word and word.

Bit	Register	Reset value	Type	Description
Bit 31: 0	MADDR	0x0000 0000	rw	Memory base address Memory address is the source or destination of data transfer. Note: The register can only be written when the CHEN bit in the corresponding channel is set 0.

9.4.7 Channel source register (DMA_SRC_SEL0)

Accessible: no-wait state, byte, half-word and word.

Bit	Register	Reset value	Type	Description
Bit 31: 24	CH4_SRC	0x00	rw	CH4 source select When DMA_FLEX_EN=1, CH4_SRC selects channel 4 source, please refer to *9.3.8 Flexible DMA request mapping.*
Bit 23: 16	CH3_SRC	0x00	rw	CH3 source select When DMA_FLEX_EN=1, CH3_SRC selects channel 3 source, please refer to *9.3.8 Flexible DMA request mapping.*
Bit 15: 8	CH2_SRC	0x00	rw	CH2 source select When DMA_FLEX_EN=1, CH2_SRC selects channel 2 source, please refer to *9.3.8 Flexible DMA request mapping*
Bit 7: 0	CH1_SRC	0x00	rw	CH1 source select When DMA_FLEX_EN=1, CH1_SRC selects channe 1 source, please refer to *9.3.8 Flexible DMA request mapping.*

9.4.8 Channel source register1 (DMA_SRC_SEL1)

Accessible: no-wait state, byte, half-word and word.

Bit	Register	Reset value	Type	Description
Bit 31: 25	Reserved	0x00	resd	Kept at its default value.
Bit 24	DMA_FLEX_EN：	0x0	rw	DMA flexible request mapping enable 0: DMA fixed request mapping mode 1: DMA flexible request mapping mode
Bit 23: 16	CH7_SRC	0x00	rw	CH7 source select When DMA_FLEX_EN=1, CH7_SRC selects channel 7 source, please refer to *9.3.8 Flexible DMA request mapping.*
Bit 15: 8	CH6_SRC	0x00	rw	CH6 source select When DMA_FLEX_EN=1, CH6_SRC selects channel 6 source, please refer to *9.3.8 Flexible DMA request mapping.*
Bit 7: 0	CH5_SRC	0x00	rw	CH5 source select When DMA_FLEX_EN=1, CH5_SRC selects channel source, please refer to *9.3.8 Flexible DMA request mapping.*

10 CRC calculation unit (CRC)

10.1 CRC introduction

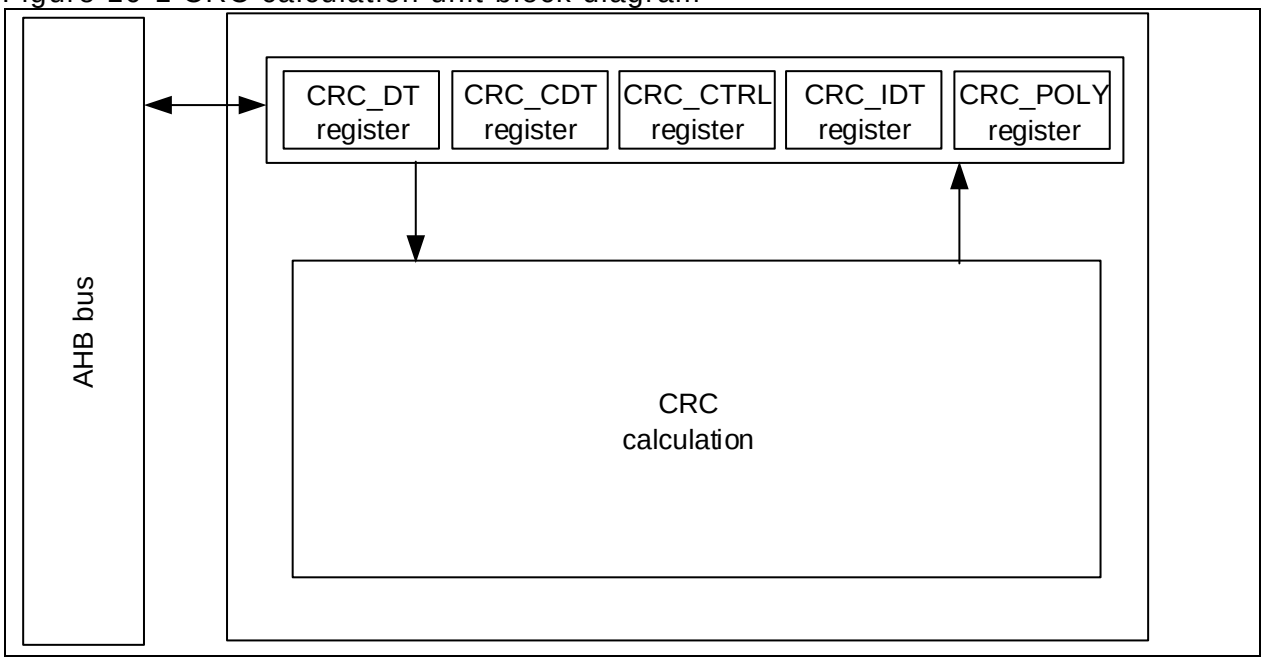
The Cyclic Redundancy Check (CRC) is an independent peripheral with CRC check feature. It follows CRC32/MPEG-2 standard.

The CRC_CTRL register is used to select output data reverse (word, REVOD=1) or input data reverse (byte, REVID=01; half-word, REVID=10; word: REVID=11). CRC calculation unit is also equipped with initialization function. After each CRC reset, the value in the CRC_IDT register is loaded with data register (CRC_DT) by CRC.

The CRC_POLY register is used to set different polynomial coefficient. The polynomial size can be set as 7 bits, 8 bits, 16 bits or 32 bits through the POLY-SIZE bit in the CRC_CTR register.

Users can write the data to go through CRC check and read the calculated result through CRC_DT register. Note that the calculation result is the combination of the previous result and the current value to be calculated.

Figure 10-1 CRC calculation unit block diagram



Main features

- Use CRC-32 code
- Support the generation of polynomial
- 4 HCLK cycles for each CRC calculation
- Support input/output data format toggle
- Perform write/read operation through CRC_DT register
- Set an initialization value with the CRC_IDT register. The value is loaded with CRC_DT register after each CRC reset.

10.2 CRC functional description

According to CRC calculation principle: the input data is taken as dividend, and the generator polynominal as a division. Using mod 2 division logic, the input data divided by the generator polynominal gets a remainder, that is, the CRC value.

CRC calculation procedure

- Input data reverse. After data input, reverse input data depending on the REVID value in CRC_CTRL register

- Initialization. The first data input needs to be XOR-ed with the initial value defined in the CRC_IDT register. If it is not the first data input, the initial value is the previously calculated result.
- CRC calculation. Dividing the input data by the generator polynominal (0x4C11DB7) using mod 2 division method produces a remainder, that is, CRC value.
- Output data toggle. Select whether to perform word toggle before output CRC value through the REVOD bit in the CRC_CTRL register
- XOR calculation. The XOR-ed result is fixed at 0x0000 0000

CRC-32/MPEG-2 parameters

- Generator polynominal: 0x4C11DB7

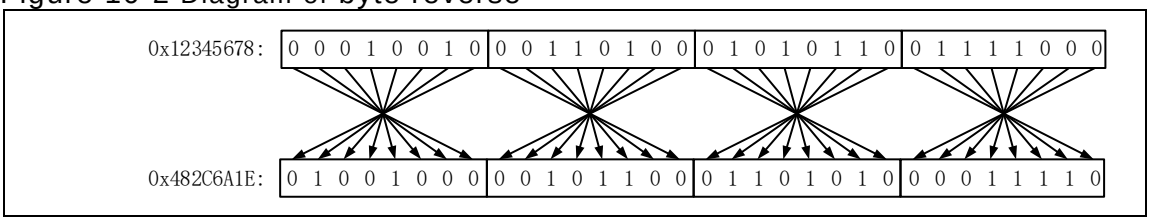
that is, $X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^{8}+X^{7}+X^{5}+X^{4}+X^{2}+X+1$

- Initial value: 0xFFFF FFFF, in order to avoid that 1-byte 0x00 data to be calculated has the same result as that of multiple-byte 0x00.
- XOR-ed value: 0x0000 0000, indicating that the CRC result will not be XOR-ed.

Reverse function

- Byte reverse, 8 bits in a group, and sequence is reversed within a group. As shown in figure below, if the original data is 0x12345678, it is reversed as 0x482C6A1E.
- Half-word reverse, 16 bits in a group, and sequence is reversed within a group
- Word reverse, 32 bits in a group, and sequence is reversed within a group

Figure 10-2 Diagram of byte reverse



10.3 CRC registers

Other registers than CRC_DT must be accessed by 32-bit words. The CRC_DT register can be accessed by byte (8-bit), half-word (16-bit) or word (32-bit).

Table 10-1 CRC register map and reset value

Register	Offset	Reset value
CRC_DT	0x00	0xFFFF FFFF
CRC_CDT	0x04	0x0000 0000
CRC_CTRL	0x08	0x0000 0000
CRC_IDT	0x10	0xFFFF FFFF
CRC_POLY	0x14	0x04C1 1DB7

10.3.1 Data register (CRC_DT)

Bit	Register	Reset value	Type	Description
Bit 31: 0	DT	0xFFFF FFFF	rw	Data register bits Used as input register when writing new data. Return CRC calculation results when it is read.

10.3.2 Common data register (CRC_CDT)

Bit	Register	Reset value	Type	Description
Bit 31: 8	Reserved	0x000000	resd	Kept at its default value.
Bit 7: 0	CDT	0x0	resd	Common 8-bit data value This field is used to store 1-byte data temporarily. It is not affected by the CRC reset caused by the RST bit in the CRC_CTRL register.

10.3.3 Control register (CRC_CTRL)

Bit	Register	Reset value	Type	Description
Bit 31: 8	Reserved	0x000000	resd	Kept at its default value.
Bit 7	REVOD	0x0	resd	Reverse output data Set and cleared by software. This bit is used to control whether to reverse output data. 0: No effect 1: Word reverse
Bit 6: 5	REVID	0x0	rw	Reverse input data Set and cleared by software. This bit is used to control how to reverse input data. 00: No effect 01: Byte reverse 10: Half-word reverse 11: Word reverse
Bit 4: 3	POLY_SIZE	0x0	rw	Polynomial size This field is used to set the size of polynomial. It is used in conjunction with the CRC_POLY register. 00: 32 bits 01: 16 bits 10: 8 bits 11: 7 bits
Bit 2: 1	Reserved	0x0	resd	Kept at its default value.
Bit 0	RST	0x0	wo	Reset CRC calculation unit Set by software. Cleared by hardware. To reset CRC calculation unit, the data register is set as 0xFFFF FFFF. 0: No effect 1: Reset

10.3.4 Initialization register (CRC_IDT)

Bit	Register	Reset value	Type	Description
Bit 31: 0	IDT	0xFFFF FFFF	rw	Initialization data register When CRC reset is triggered by the RST bit in the CRC_CTRL register, the value in the initialization register is written into the CRC_DT register as an initial value.

10.3.5 Polynomial register (CRC_POLY)

Bit	Register	Reset value	Type	Description
Bit 31: 0	POLY	0x04C1 1DB7	rw	Polynomial coefficient The generated polynomial is a divisor in CRC calculation. Using CRC32 mode, this polynomial coefficient is 0x4C11DB7. Users can also set the polynomial coefficient according to their needs.

11 I²C interface

11.1 I²C introduction

I2C (inter-integrated circuit) bus interface manages the communication between the microcontroller and serial I²C bus. It supports master and slave modes, with up to 400 kbit/s of communication speed.

11.2 I²C main features

- I2C bus
  - Master and slave modes
  - Multimaster capability
  - Stand speed (100 kHz) and fast speed (400 kHz)
  - 7-bit and 10-bit address modes
  - Broadcast call mode
  - Status flag
  - Error flag
  - Clock stretching capability
  - Communication event interrupts
  - Error interrupts
- Support DMA transfer
- Support partial SMBus2.protocol
  - PEC generation and verification
  - SMBus reminder function
  - ARP(address resolution protocol)
  - Timeout mechanism
- PMBus

Note: I2S frequency can be up to 1 MHz. For details on this, please contact your local or nearest ARTERY sales office for further support.

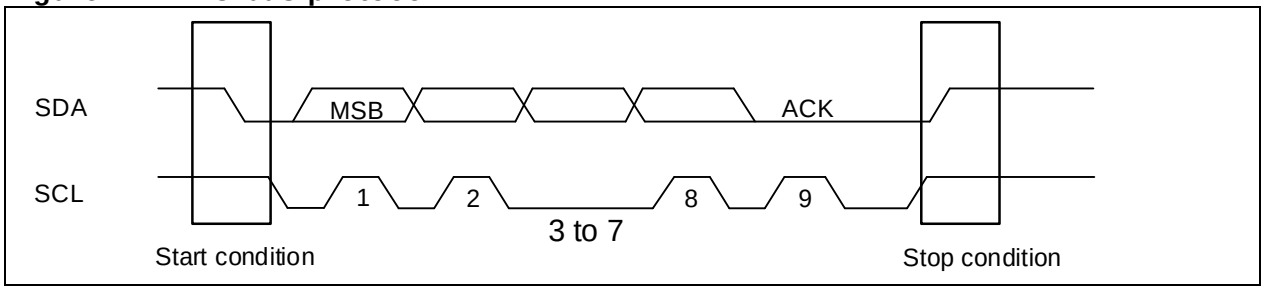
11.3 I²C function overview

I²C bus consists of a data line (SDA) and clock line (SCL). It can achieve a maximum of 100 kHz speed in standard mode, while up to 400kHz in fast mode. A frame of data transmission begins with a Start condition and ends with a Stop condition. The bus is kept in busy state after receiving the Start condition, and becomes idle as long as it receives the Stop condition.

Start condition: When SCL is set high, SDA switches from high to low

Stop condition: When SCL is set high, SDA switches from low to high.

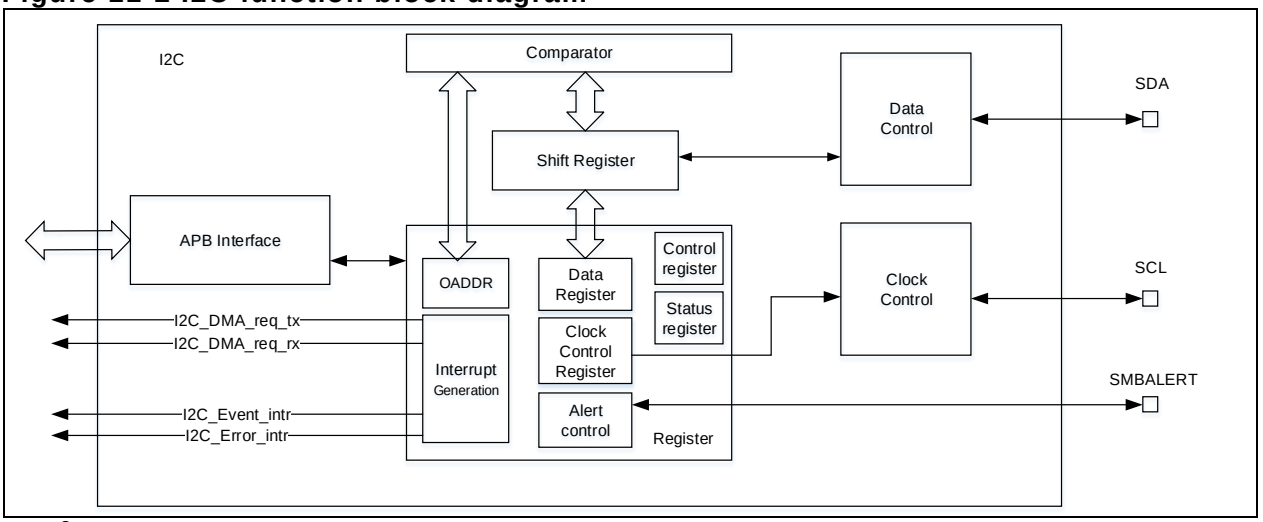
Figure 11-1 I2C bus protocol



11.4 I²C interface

Figure 11-2 shows the block diagram of I²C function.

Figure 11-2 I2C function block diagram



1. I²C clock

I²C is clocked by either APB1 or APB2. The I²C clock division is achieved by setting the CLKFREQ[7: 0] in the I2C_CTRL2 register. The minimum clock frequency varies from one mode to another, that is, at least 2 MHz in standard mode, but 4 MHz in fast mode.

2. Operation mode

I²C bus interface can operate both in master mode and slave mode. Switching from master mode to slave mode, vice versa, is supported as well. By default, the interface operates in slave mode. When GENSTART=1 is set (Start condition is activated), the I²C bus interface switches from slave mode to master mode, and returns to slave mode automatcially at the end of data transfer (Stop condition is triggered).

- Master transmitter
- Master receiver
- Slave transmitter
- Slave receiver

3. Communication process

- Master mode communication:

1. Start condition generation
2. Address transmission
3. Data Tx or Rx
4. Stop condition generation
5. End of communication

- Slave mode communication:

1. Wait until the address is matched.
2. Data Tx or Rx
3. Wait for the generation of Stop condition
4. End of communication

4. Address control

Both master and slave support 7-bit and 10-bit addressing modes.

Slave address mode:

- In 7-bit mode
  - ADDR2EN=0 stands for single address mode: only match OADDR1
  - DUALEN=1 stands for dual address mode: match OADDR1 and OADDR2

- In 10-bit mode
  - Only match OADDR1

Support special slave address:

- Broadcast call address (0b0000000x): This address is enabled when GCAEN=1.
- SMBus device default address (0b1100001x): This address is enabled for SMBus address resolution protocol in SMBus device mode.
- SMBus master default address (0b0001000x): This address is enabled for SMBus master notification protocol in SMBus master mode.
- SMBus alert address (0b0001100x): This address is enabled for SMBus alert response address protocol in SMBus master mode when SMBALERT = 1

Refer to SMBus2.0 protocol for more information.

Slave address matching procedure:

- Receive a Start condition
- Address matching
- The slave sends ACK if address is matched.
- ADDR7F is set 1, with DIRF indicating the transmission direction
  - When DIRF=0, slave enters receiver mode, starting receiving data.
  - When DIRF=1, slave enters transmitter mode, starting transmitting data

5. Clock stretching capability

Clock stretching is enabled by setting the STRETCH bit in the I2C_CTRL1 register. Once enabled, when the slave cannot process data in a timely manner on certain conditions, it will pull down SCL line to low level to stop communication in order to prevent data lost.

- Transmitter mode:
  - Clock stretching enable: If no data is written to the I2C_DT register before the next byte transimission (the first SCL rising edge of the next data), the I^2C interface will pull down SCL bus and wait until the data is written to the I2C_DT
  - Clock stretching disable: if no data is written to the I2C_DT register before the next byte transmission (the first SCL rising edge of next data), an underrun error will happen.
- Receiver mode
  - Clock stretching enable: When the shift register has received another byte before the data in the I2C_DT register is read, the I^2C will hold the SCL bus low to wait for the software to read I2C_DT register
  - Clock stretching disable: The data in the I2C_DT register is not yet read when the shift register receives another byte. In this case, if another data is received, an overrun error occurs.

11.4.1 I²C slave communication flow

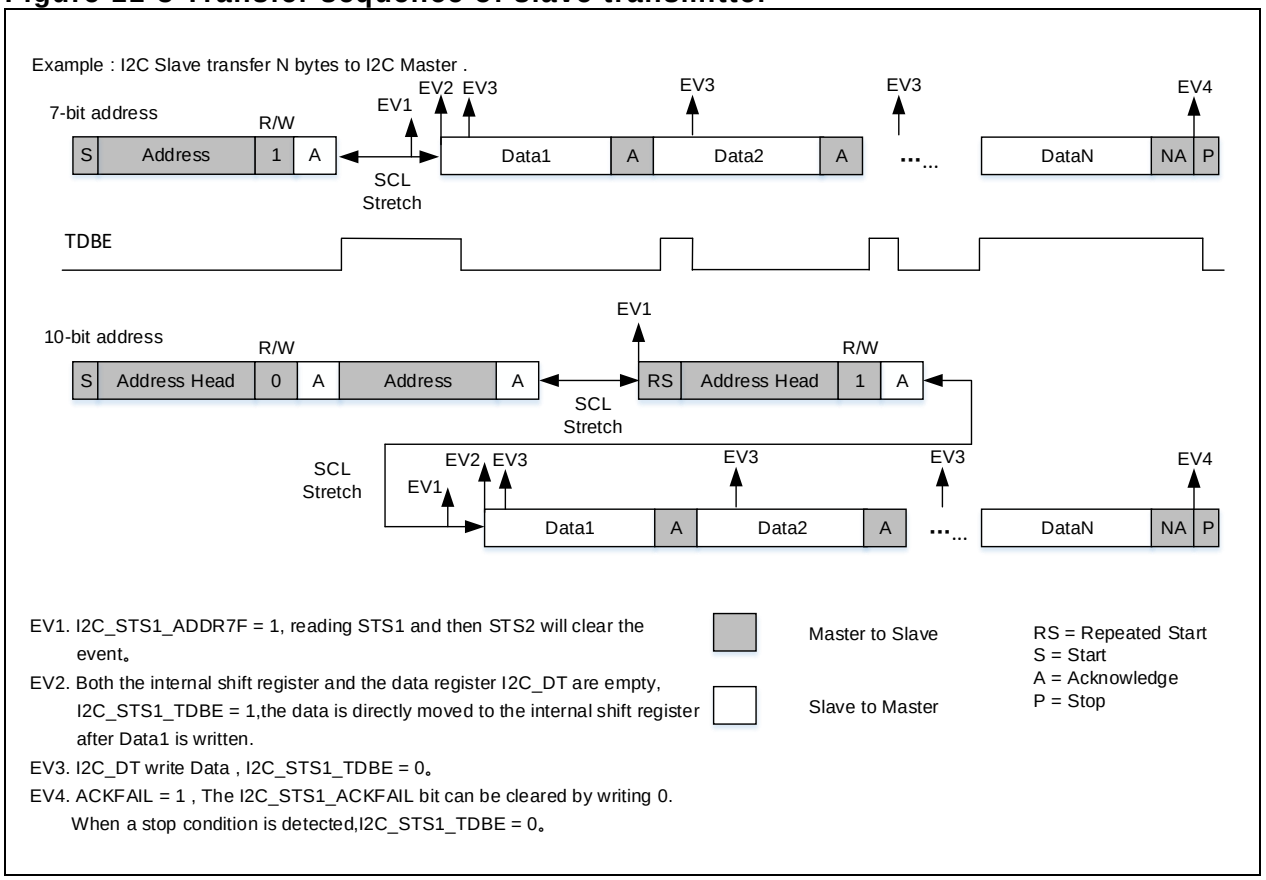
Initialization

Enable I²C peripheral clock, and configure the clock-related bits in the I2C_CTRL2 register for a correct timing, and then wait for I²C master to send a Start condition.

Transmitter

Figure 11-3 shows the transfer sequence of slave transmitter.

Figure 11-3 Transfer sequence of slave transmitter



7-bit address mode:

1. Wait for the master to send addresses
2. EV1: Address is matched (ADDR7F=1), and then the slave pulls the SCL bus low. Reading STS1 and then STS2 by software clears the ADDR7F bit. It then enters transmission stage, and both DT register and internal shift register are now empty. The TDBE bit is set 1 by hardware.
3. EV2: When the data is written to the DT register, it is directly moved to the shift register and the SCL bus is released. The TDBE bit is still set 1 at this time.
4. EV3: The DT register remains empty, but the shift register is not. Writing to the DT register clears the TDBE bit.
5. EV4: After receiving the ACKFAIL event from the master, ACKFIAL=1 is activated. Writing 0 to the ACKFIAL bit clears the event.
6. End of communication.

10-bit address mode:

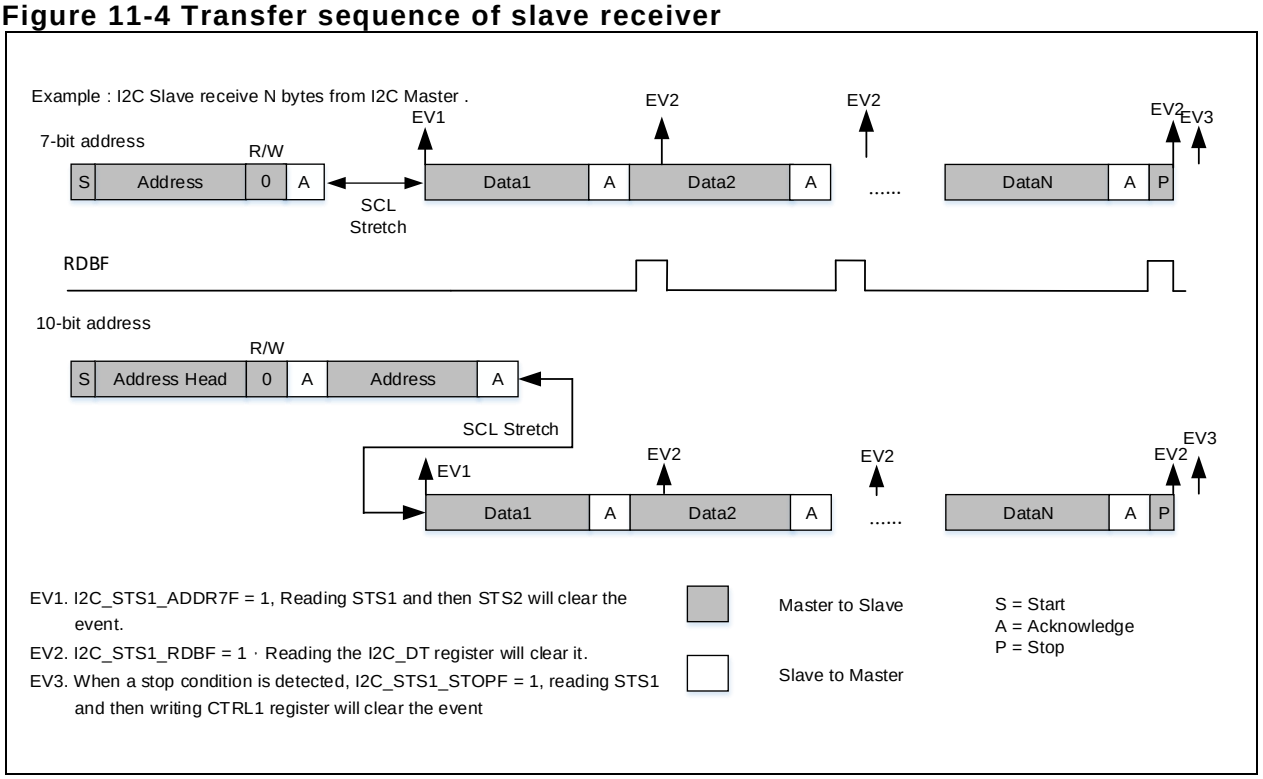
1. Wait for the master to send an address
2. EV1: Address is matched (ADDR7F=1), and then the slave pulls the SCL bus low. Reading STS1 and then STS2 by software clears the ADDR7F bit. Wait for the master to re-send Start condition.
3. EV1: Address is matched (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit once more. It then enters transmission stage. Both DT register and shift register are empty. The TDBE is set 1 by hardware.

4. EV2: When the data is written to DT register, it is directly moved to the shift register, and SCL bus is released. The TDBE is still set 1 at this time.
5. EV3: The DT register remains empty but the shift register is not. Writing to the DT register clears the TDBE bit.
6. EV4: After receiving the ACKFAIL event from the master, ACKFIAL=1 is activated. Writing 0 to the ACKFIAL bit clears the event.
7. End of communication.

Slave receiver

Figure 11-4 shows the transfer sequence of slave receiver.

Figure 11-4 Transfer sequence of slave receiver



7-bit address mode:

1. Wait for the master to send an address.
2. EV1: Address is matched (ADDR7F=1), and the slave pulls the SCL bus low. Reading STS1 and then STS2 by software clears the ADDR7F bit. At this point, the SCL bus is released, and enters receive stage.
3. The internal shift register receives the bus data and stores them to DT register.
4. EV2: After receiving the bytes, the RDBF bit is set to1. Reading the I2C_DT register clears the RDBF bit.
5. EV3: After receiving the Stop condition from the master, STOPF=1 is activated. Reading STS1 and then writing to CTRL1 register clears the event.
6. End of communication.

10-bit address mode:

1. Wait for the master to send an address.
2. EV1: Address is matched (ADDR7F=1). The slave pulls the SCL bus low. Reading STS1 and then STS2 by software clears the ADDR7F bit. At this point, the SCL bus is released, and enters receive stage.
3. The internal shift register receives the bus data and stores them to DT register.
4. EV2: After receiving the byte, the RDBF bit is set to 1. Reading the I2C_DT register clears the RDBF bit.
5. EV3: After receiving the Stop condition from the master, STOPF=1 is activated. Reading STS1

and then writing to CTRL1 register clears the event.

6. End of communication.

11.4.2 I²C master communication flow

Initialization

1. Porgram input clock to generate correct timing through the CLKFREQ bit in the I2C_CTRL2 register;
2. Program I²C communication speed through the I2C_CLKCTRL bit in the clock control register;
3. Program the maximum rising time of bus through the I2C_TMRISE register;
4. Program the control register1 I2C_CTRL1;
5. Enable peripherals, if the GENSTART bit is set, a Start condition is generated on the bus, and the device enters master mode.

Slave address transmission

Slave address is divided into 7-bit and 10-bit modes. Whether it is transmitter mode or receiver mode depends on the lowest address bit.

- 7-bit address mode:

  Transmitter: When the lowest bit of the address sent is 0, the master enters transmitter mode.

  Receiver: When the lowest bit of the address sent is 1, the master enters receiver mode.

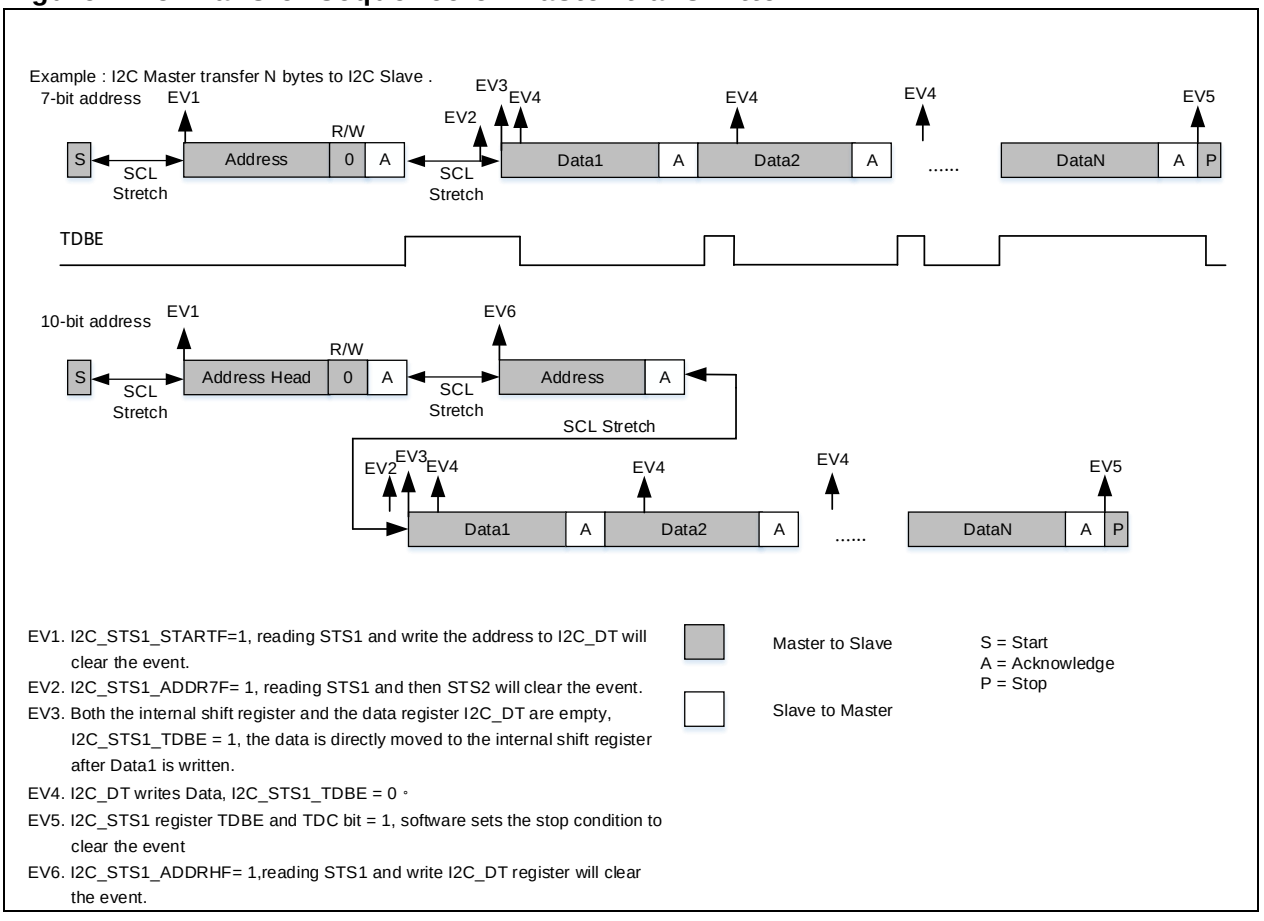
- 10-bit address mode:

  Transmitter: First send address head 0b11110xx0 (where xx refers to address [9: 8]), and then slave address [7: 0], the master enters transmitter mode.

  Receiver: First send slave address head 0b11110xx0 (where xx refers to address [9:8]) and then address [7: 0], followed by the address head 0b11110xx1 (where xx refers to address [9: 8]), the master enters receiver mode.

Master transmitter

Figure 11-5 Transfer sequence of master transmitter



- **7-bit address mode:**

1. Generate a Start condition (GENSTART=1)
2. EV1: Start condition is ready (STARTF=1). Read STS1 by software and write the address to DT register.
3. EV2: Address is matched successfully (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit. At this point, the master enters transmit stage, and both DT register and internal shift regiser are empty. The TDBE bit is set 1 by hardware.
4. EV3: When the data is written to the DT register, it is directly moved to the shift register and the SCL bus is released. The TDBE bit is still set 1 at this time.
5. EV4: The DT register remains empty but the shift register is not. Writing to the DT register clears the TDBE bit.
6. The TDBE bit is set only after the second-to-last byte is sent.
7. EV5: TDC=1 indicates that the byte transmission is complete. The master sends a Stop condition (STOPF=1). The TDBE bit and TDC bit are cleared automatically by hardware.
8. End of communication.

- **10-bit address mode:**

1. Generate Start condition (GENSTART=1)
2. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
3. EV6: 10-bit address head sequence is sent. Reading STS1 and writing to DT register clears the ADDRHF bit.
4. EV2: Address is matched successfully (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit. In this case, the master enters transmit stage, and both DT register and internal shift regiser are empty. The TDBE bit is set 1 by hardware.
5. EV3: When the data is written to the DT register, it is directly moved to the shift register and the SCL bus is released. The TDBE bit is still set 1 at this time.
6. EV4: At this point, the DT register remains empty but the shift register is not. Writing to the DT register clears the TDBE bit.
7. The TDBE bit is set only after the second-to-last byte is sent.
8. EV5: TDC=1 indicates that the byte transmission is complete. The master sends Stop condition (STOPF=1). The TDBE bit and TDC bit is cleared by hardware.
9. End of communication.

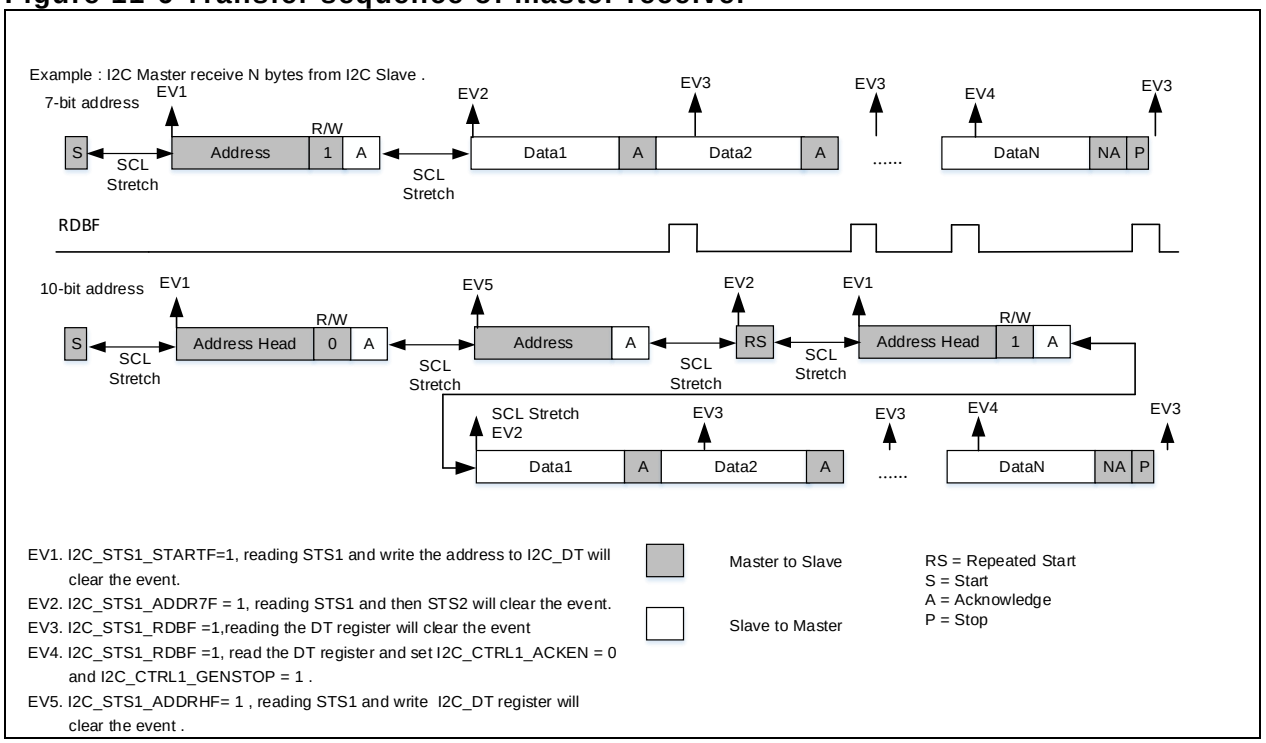
Master receiver

Data reception depends on I^2C interrupt priority:

1. **Very high priority**

- When the second-to-last byte is being read, clear the ACKEN bit and set the GENSTOP bit in the I2C_CTRL1 register to generate a Stop condition.
- If only one byte is received, clear the ADDR7F flag and set the ACKEN and GENSTOP bit in the I2C_CTRL1 register.
- After the byte is received, the I2C_STS1_RDBF bit is set 1 by hardware, and it is cleared after the software reads the I2C_DT register.

Figure 11-6 Transfer sequence of master receiver



- **7-bit address mode:**

1. Generate a Start condition (GENSTART=1)
2. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
3. EV2: Address is matched successfully (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit. In this case, the master enters receive stage.
4. EV3: The RDBF bit is set 1 after a byte is received. Reading the I2C_DT register clears the RDBF.
5. EV4: Once the second-to-last byte is received, the ACKEN bit must be cleared and the GENSTOP must be set by software.
6. EV3: The RDBF bit is set 1 after receiving a byte. Reading the I2C_DT register clears the RDBF.
7. End of communication.

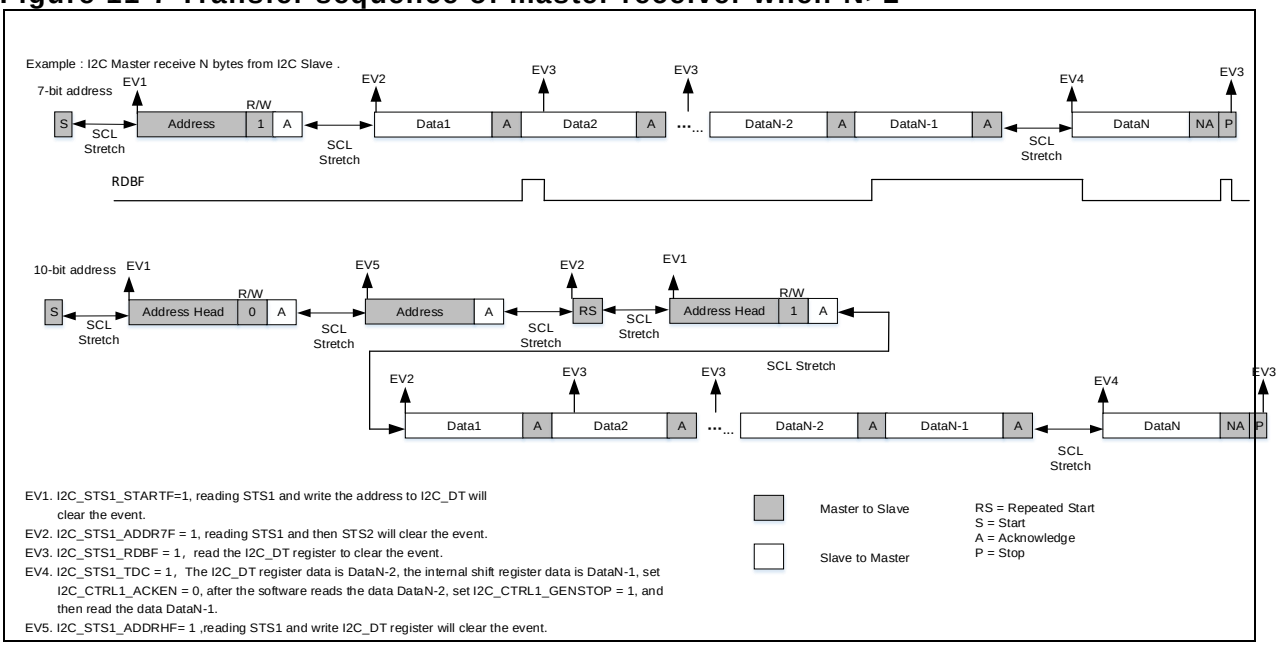
- **10-bit address mode:**

1. Generate Start condition (GENSTART=1)
2. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
3. EV5: 10-bit address head sequence is sent. Reading STS1 and writing to DT register can clear the ADDRHF bit.
4. EV2: Address is matched successfully (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit, and the master re-send a Start condition (GENSTART=1).
5. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
6. EV2: Address is matched successfully (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit. The master enters receive stage..
7. EV3: The RDBF bit is set 1 after receiving a byte. Readomg the I2C_DT register clears the RDBF.
8. EV4: Once the second-to-last byte is received, the ACKEN bit must be cleared and the GENSTOP must be set by software.
9. EV3: The RDBF bit is set 1 after receiving the byte. Readomg the I2C_DT register clears the RDBF.
10. End of communication.

2. **When I2C interrupt priority is not very high but the number of bytes to receive is grearter than 2**

- The third-to-last byte (N-2) is not read when being received. It is read only after the ACKEN bit in the I2C_CTRL1 register is cleared when the second-to-last byte (N-1) is received. Then the second-to-last byte (N-1) is read after the GENSTOP bit in the I2C_CTRL1 register is set. Afterwards, the bus starts to receive the last one byte.

Figure 11-7 Transfer sequence of master receiver when N>2



- **7-bit address mode:**
  1. Generate a Start condition (GENSTART=1)
  2. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
  3. EV2: Address is matched successfully (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit, and the master enters receive stage.
  4. EV3: The RDBF bit is set 1 after receiving the byte. Reading the I2C_DT register clears the RDBF.
  5. EV4: TDC=1, the contens in the I2C_DT is N-2, and that of the shift register is N-1. The ACKEN is set 0 by software and the data N-2 is read, afterwards, the GENSTOP=1, and data N-1 is read.
  6. EV3: The RDBF bit is set 1 after receiving the byte. Reading the I2C_DT register clears the RDBF.
  7. End of communication.
- **10-bit address mode:**
  1. Generate Start condition (GENSTART=1)
  2. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
  3. EV5: 10-bit address head sequence is sent. Reading STS1 and writing to DT register can clear the ADDRHF bit.
  4. EV2: Address is matched successfully (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit, and the master re-send Start condition.
  5. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to the DT register.
  6. EV2: Address is matched successfully (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit, and the master enters receive stage.
  7. EV3: The RDBF bit is set 1 after receiving a byte. Reading the I2C_DT register clears the RDBF.
  8. EV4: TDC=1, the contens in the I2C_DT is N-2, and that of the shift register is N-1. The

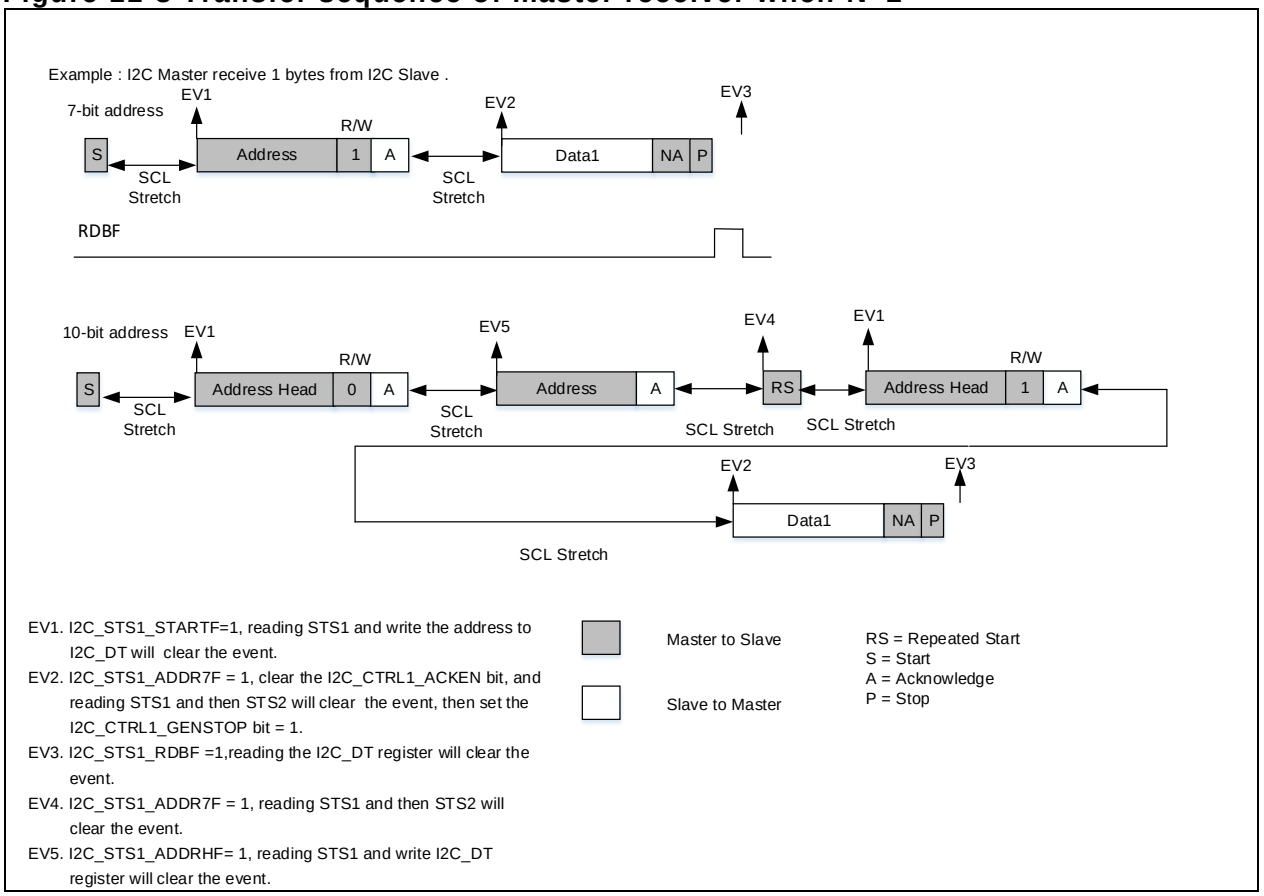
ACKEN is set 0 by software and the data N-2 is read, afterwards, the GENSTOP=1, and data N-1 is read.

9. EV3: The RDBF bit is set 1 after receiving a byte. Reading the I2C_DT register clears the RDBF.
10. End of communication.

3. **When I2C interrupt priority is not very high but the number of bytes to receive is equal to 2**

- Set the MACKCTRL bit in the I2C_CTRL1 register before data reception. When the address is matched, clear ACKEN bit and then the ADDR7F bit. When the TDC bit is set 1, set the GENSTOP bit in the I2C_CTRL1 register, and then read the DT register.

Figure 11-8 Transfer sequence of master receiver when N=2



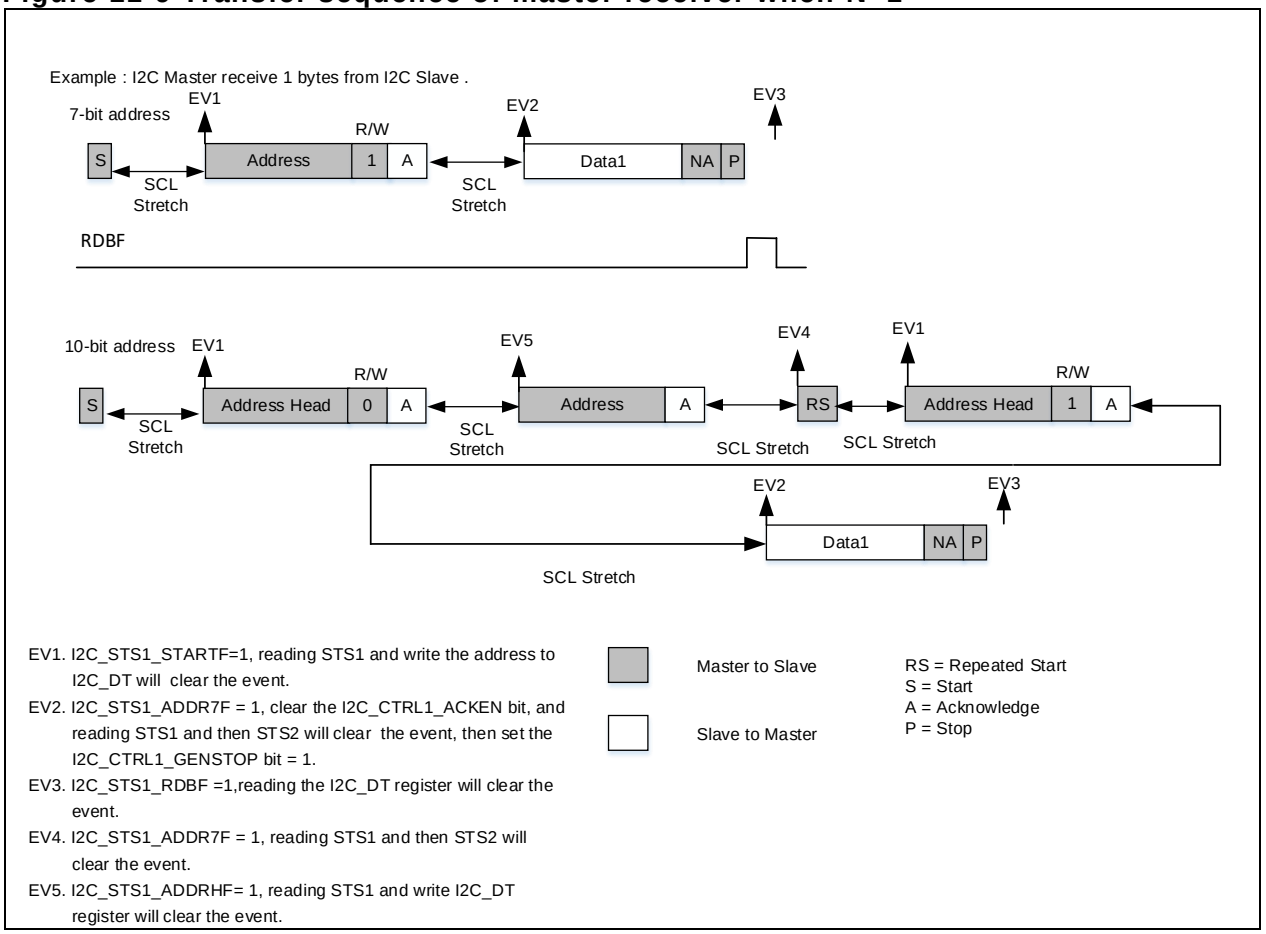
- **7-bit address mode:**
  1. Set MACKCTRL=1 in the I2C_CTRL1 register
  2. Generate a Start condition (GENSTART=1)
  3. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
  4. EV2: Address is matched successfully (ADDR7F=1). Clear the ACKEN bit and read STS1 and STS2 clears the ADDR7F bit, the master enters receive state at this time.
  5. EV2: TDC=1, set GENSTOP=1, and then read the I2C_DT register twice.
  6. End of communication.
- **10-bit address mode:**
  1. Set MACKCTRL=1 in the I2C_CTRL1 register
  2. Generate a Start condition (GENSTART=1)
  3. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
  4. EV4: 10-bit address head is sent. Reading STS1 and writing to DT register can clear the ADDRHF bit.
  5. EV2: Address is matched successfully (ADDR7F=1). Reading STS1 and then STS2 clears the ADDR7F bit, and the master re-send Start condition.
  6. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to the DT register.

7. EV2: Address is matched successfully (ADDR7F=1). Clear the ACKEN bit and read STS1 and STS2 clears the ADDR7F bit, the master enters receive state at this time.
8. EV3: TDC=1, set GENSTOP=1, and then read the I2C_DT register twice.
9. End of communication.

4. **When I2C interrupt priority is not very high but the number of bytes to receive is equal to 1**

- After the address is matched, clear the ACKEN bit and then ADDR7F bit, then set the GENSTOP bit in the I2C_CTRL1 register. Wait until the RDBF bit is set 1 before reading the DT register.

Figure 11-9 Transfer sequence of master receiver when N=1



- **7-bit address mode:**
  1. Generate a Start condition (GENSTART=1)
  2. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
  3. EV2: Address is matched successfully (ADDR7F=1). Clear the ACKEN bit, reading STS1 and then STS2 clears the ADDR7F bit. Afterwards, set GENSTOP=1, the master enters receive stage at this time.
  4. EV3: RDBF=1. Reading the I2C_DT register clears the RDBF.
  5. End of communication.
- **10-bit address mode:**
  1. Generate a Start condition (GENSTART=1)
  2. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to DT register.
  3. EV5: 10-bit address head is sent. Read STS1 and write to DT register can clear the ADDRHF bit.
  4. EV4: Address is matched successfully (ADDR7F=1). Reading STS1 and STS2 clears the ADDR7F bit, the master re-sends Start condition (GENSTART=1).
  5. EV1: Start condition is ready (STARTF=1). Read STS1 and write the address to the DT register.
  6. EV2: Address is matched successfully (ADDR7F=1). Clearing the ACKEN bit, read STS1 and then STS2 clears the ADDR7F bit. Afterwards, set GENSTOP=1, the master enters receive

stage at this time.

7. EV3: RDBF=1. Reading the I2C_DT register clears the RDBF.
8. End of communication.

11.4.3 Utilize DMA for data transfer

I²C data transfer can be done using DMA controller. An interrupt is generated by enabling the transfer complete interrupt bit. The DATAIEN bit in the I2C_CTRL2 register must be set 0 when using DMA for data transfer. The following sequence is for data transfer with DMA.

Transmission using DMA

1. Set the peripheral address (DMA_CxPADDR= I2C_DT address)
2. Set the memory address (DMA_CxMADDR=data memory address)
3. The transmission direction is set from memory to peripheral (DTD=1 in the DMA_CHCTRL register)
4. Configure the total number of bytes to be transferred in the DMA_CxDTCNT register
5. Configure other parameters such as priority, memory data width, peripheral data width, interrupts, etc in the DMA_CHCTRL register
6. Enable the DMA channel by setting CHEN=1 in the DMA_CxCTRL register
7. Enable I²C DMA request by setting DMAEN=1 in the I2C_CTRL2 register. Once the TDBE bit in the I2C_STS1 register is set, the data is loaded from the programmed memory to the I2C_DT register through DMA
8. When the number of data transfers, programmed in the DMA controller, is reached (DMA_CxDTCNT=0), the data transfer is complete (An interrupt is generated if enabled).
9. Master transmitter: Once the TDC flag is set, the STOP condition is generated, indicating that transfer is complete.

   Slave transmitter: Once the ACKFAIL flag is set, clear the ACKFAIL flag, transfer is complete.

Reception using DMA

1. Set the peripheral address (DMA_CxPADDR = I2C_DT address)
2. Set the memory address (DMA_CxMADDR = memory address)
3. The transmission directionis set from peripheral to memory (DTD=0 in the DMA_CHCTRL register)
4. Configure the total number of bytes to be transferred in the DMA_CxDTCNT register
5. Configure other parameters such as priority, memory data width, peripheral data width, interrupts, etc in the DMA_CHCTRL register
6. Enable the DMA channel by setting CHEN=1 in the DMA_CxCTRL register
7. Enable I²C DMA request by setting DMAEN=1 in the I2C_CTRL2 register. Once the RDBE bit in the I2C_STS1 register is set, the data is loaded from the I2C_DT register to the programmed memory through DMA
8. When the number of data transfers, programmed in the DMA controller, is reached (DMA_CxDTCNT=0), the data transfer is complete (An interrupt is generated if enabled).
9. Master receiver: Clear the ACKFAIL flag, the STOP condition is generated, indicating that the transfer is complete (when the number of bytes to be transferred is greater >=2 and DMAEND=1, the NACK signal is generated automatically after transfer complete (DMA_CxDTCNT=0))

   Slave receiver: Once the STOPF flag is set, clear the STOPF flag, and the transfer is complete.

11.4.4 SMBus

The System Management Bus (SMBus) is a two-wire interface through which various devices can communicate with each other. It is based on I²C. With SMBus, the device can provide manufacturer information, tell the system its model/part number, report different types of errors and accept control parameters and so on. For more information, refer to SMBus 2.0 protocol.

Differences between SMBus and I²C

1. SMBus requires a minimum speed of 10 kHz for the purpose of management and monitor. It is quite easy to know whether the bus is in Idle state or not as long as a parameter is input while running on a certain transmission speed, without the need of detecting the STOP signals one after another, or even keeping STOP and other parameter monitor. There is no limit for I²C.
2. SMBus transmission speed ranges from 10 kHz to 100 kHz. In contrast,I2C has no minimum requirement, and its maximum speed varies from one mode to another, namely, 100 kHz in standard mode and 400 kHz in fast mode.
3. After reset, SMBus needs 35 ms of timeout, but there is no limit for I2C in this regard.

SMBus applications

1. The I²C interface is set in SMBus mode by setting PERMODE=1 in the I2C_CTRL1 register.
2. Select SMBus mode:
   SMBMODE=1: SMBus host
   SMBMODE=0: SMBus device
3. Other configurations are the same as those of I²C.

SMBus protocols are implemented by the user software, while I²C interface only provide the address identification of these protocols

SMBus address resolution protocol (ARP)

SMBus address conflicts can be resolved by dynamically assigning a new uique address to each device. Refer to SMBus 2.0 protocol for more information about ARP.

Setting the ARPEN bit can enable the I²C interface to recognize the default device address (0b1100001x). However, unique device identifier (UDID) and the detailed protocol implementation should be handled by software.

SMBus host notify protocol

The slave device can send data to the master device through SMBus host notify protocol. For example, the slave can notify the host to implement ARP with this protocol. Refer to SMBus 2.0 protocol for details on SMBus host notify protocol.

When the ARP mode is enabled (ARPEN=1) in host mode (SMBMODE=1), the I²C interface is enabled to recognize the 0b0001000x (default host address)

SMBus Alert

SMBus Alert is an optional signal that connects the ALERT pin between the host and the salve. With this signal, the slave notifies the host to access the slave. SMBALERT is a wired-AND signal. For more information about SMBus Alert, refer to SMBus2.0 protocol.

The detailed sequences are as follows:

SMBus host:

1. Enable SMBus Alert mode by setting SMBALERT=1
2. Enable ALERT interrupt if necessary
3. When an alert event occurs on the ALERT pin (ALERT pin changes from high to low)
4. The host will generate ALERT interrupt if enabled
5. The host then processes the interrupt and accesses to all devices through ARA (Alert Response Address 0001100x) so as to get the slave addresses. Only the devices with pulled-down SMBALERT can acknowledge ARA.
6. The host then continues to operate based on the slave addresses available.

SMBus slave:

1. When an alert event occurs and the ALERT pin changes from high to low (SMBALERT=1), the slave responses to ARA (Alert Response Address) address (0001100x)
2. Enable ALERT interrupt if necessary (an interrupt is generated when receiving ARA address)
3. Wait until the host gets the slave addresses through ARA
4. Report its own address, but it continues to wait if the arbitration is lost.
5. Address is reported properly, and the ALERT pin is released (SMBALERT=0).

Packet error checking (PEC)

Packet erro checking (PEC) is used to guarantee the correctness and integrity of data transfer. This is done by using CRC-8 polynominal:

$C(x) = x^8 + x^2 + x + 1$

PEC calculation is enabled when PECEN=1 to check address and data. It becomes invalid when the arbitration is lost.

PEC transmission:

- Common mode: Set PECTRA=1 after the last TDBE event so that PEC is transferred after the last transmitted byte.
- DMA mode: The PEC is transferred automatically after the last transmitted byte. For example, if the number of data to be transferred is 8, then DMA_TCNTx=8.

PEC reception:

- Common mode: Set the PECTRA bit after the last RDBF event. The PECTRA must be set before the ACK pulse of the current byte is received.
- DMA mode: When receiving, it will automatically consider the last byte as PECVAL and check it. For example, if the number of data to be transferred is 8, then DMA_TCNTx=9.

In reception mode, the NACK will be generated when PEC fails.

11.4.5 I²C interrupt requests

The following table lists all the I²C interrupt requests.

Interrupt event	Event flag	Enable control bit
Start condition sent (Host)	STARTF	EVTIEN
Address sent (host) or address matched (slave)	ADDR7F	
10-bit address head sent (host)	ADDRHF	
Data transfer complete	TDC	
Stop condition received (slave)	STOPF	
Transmit data buffer empty	TDBE	EVTIEN and DATAIEN
Receive data buffer full	RDBF	
SMBus alert	ALERTF	ERRIEN
Timeout error	TMOUT	
PEC error	PECERR	
Overload/underload	OUF	
Acknowledge failure	ACKFAIL	
Arbitration lost	ARLOST	
Bus error	BUSERR	

11.4.6 I²C debug mode

When the microcontroller enters debug mode (Cortex®-M4F halted), the SMBUS timeout either continues to work or stops, depending on the I2Cx_SMBUS_TIMEOUT configuration bit in the DEBUG module.

11.5 I²C registers

These peripheral registers must be accessed by half-word (16 bits) or word (32 bits).

Table 11-1 I²C register map and reset value

Register	Offset	Reset value
I2C_CTRL1	0x00	0x0000
I2C_CTRL2	0x04	0x0000
I2C_OADDR1	0x08	0x0000
I2C_OADDR2	0x0C	0x0000
I2C_DT	0x10	0x0000
I2C_STS1	0x14	0x0000
I2C_STS2	0x18	0x0000
I2C_CLKCTRL	0x1C	0x0000
I2C_TMRISE	0x20	0x0002

11.5.1 Control register1 (I2C_CTRL1)

Bit	Register	Reset value	Type	Description
Bit 15	RESET	0x0	rw	I²C peripheral reset 0: I²C peripheral is not at reset state. 1: I²C peripheral is at reset state. Note: This bit can be used only when the BUSYF bit is “1”, and no Stop condition is detected on the bus.
Bit 14	Reserved	0x0	resd	Kept at its default value.
Bit 13	SMBALERT	0x0	rw	SMBus alert pin set This bit is set or cleared by software. It is cleared by hardware when I2CEN=0. 0: SMBus alert pin high. 1: SMBus alert pin low.
Bit 12	PECTEN	0x0	rw	Request PEC transfer enable This bit is set or cleared by software. It is cleared by hardware after PECTEN is sent, or under Start/Stop condition. 0: No PEC transfer 1: PEC transfer
Bit 11	MACKCTRL	0x0	rw	Master receive mode acknowledge control 0: ACKEN bit controls ACK of the current byte being transferred 1: ACKEN bit controls ACK of the next byte to be transferred. This bit is used only when the number of bytes to receive is equal to 2 so as to ensure that the host responds to ACK in time.
Bit 10	ACKEN	0x0	rw	Acknowledge enable This bit is set or cleared by software. 0: Disabled (no acknowldge sent) 1: Enabled (acknowledge sent)

Bit 9	GENSTOP	0x0	rw	Generate stop condition This bit is set or cleared by software. It is cleared when a Stop condition is detected. It is set by hardware when a timeout error is detected. 0: No Stop condition is generated. 1: Stop condition is generate. The salve releases the SCL and SDA lines when this bit is set in slave mode.
Bit 8	GENSTART	0x0	rw	Generate start condition This bit is set or cleared by software. It is cleared when a Start condition is sent. 0: No Start condition is generated. 1: Start condition is generated.
Bit 7	STRETCH	0x0	rw	Clock stretching mode 0: Enabled 1: Disabled Note: This feature applies to slave mode only.
Bit 6	GCAEN	0x0	rw	General call address enable 0: Enabled 1: Disabled
Bit 5	PECEN	0x0	rw	PEC calculation enable 0: Disabled 1: Enabled
Bit 4	ARPEN	0x0	rw	SMBus address resolution protocol enable 0: Disabled 1: Enabled SMBus host: response to host address 0001000x SMBus slave: response to default device address 0001100x
Bit 3	SMBMODE	0x0	rw	SMBus device mode 0: SMBus slave 1: SMBus host
Bit 2	Reserved	0x0	resd	Forced to be 0 by hardware.
Bit 1	PERMODE	0x0	rw	I^2C peripheral mode 0: I^2C mode 1: SMBus mode
Bit 0	I2CEN	0x0	rw	I^2C peripheral enable 0: Disabled 1: Enabled All bits are cleared as I2CEN = 0 at the end of the communication. In master mode, this bit must not be cleared before the end of the communication.

Note: When the GENSTART, GENSTP or PECTEN bit is set, the I2C_CTRL1 cannot be written by software until the corresponding bit has been cleared by hardware,otherwise, a second GENSTART, GENSTP or PECTEN request may be set.

11.5.2 Control register2 (I2C_CTRL2)

Bit	Register	Reset value	Type	Description
Bit 15: 13	Reserved	0x0	resd	Forced to be 0 by hardware.
Bit 12	DMAEND	0x0	rw	End of DMA transfer 0: The next DMA transfer is no the last one. 1: The next DMA transfer is the last one.
Bit 11	DMAEN	0x0	rw	DMA transfer enable 0: Disabled 1: Enabled
Bit 10	DATAIEN	0x0	rw	Data transfer interrupt enable An interrupt is generated when TDBE =1 or RDBF=1. 0: Disabled 1: Enabled
Bit 9	EVTIEN	0x0	rw	Event interrupt enable 0: Disabled 1: Enabled An interrupt is generated in the following conditions: – STARTF = 1 (Master mode) – ADDR7F = 1 (Master/slave mode) – ADDRHF= 1 (Master mode) – STOPF = 1 (Slave mode) – TDC = 1, but no TDBE or RDBF event – If DATAIEN = 1, the TDBE event is 1. – If DATAIEN = 1, the RDBF event is 1.
Bit 8	ERRIEN	0x0	rw	Error interrupt enable 0: Disabled 1: Enabled An interrupt is generated in the following conditions: – BUSERR = 1 – ARLOST = 1 – ACKFAIL = 1 – OVER = 1 – PECERR = 1 – TMOUT = 1 – ALERTF = 1
Bit 7: 0	CLKFREQ	0x00	rw	I^2C input clock frequency Correct input clock frequency must be set to generate correct timings. The range allowed is between 2 MHz and 120 MHz. 2: 2MHz 3: 3MHz …… 120: 120MHz

11.5.3 Own address register1 (I2C_OADDR1)

Bit	Register	Reset value	Type	Description
Bit 15	ADDR1MODE	0x0	rw	Address mode 0: 7-bit address 1: 10-bit address
Bit 14: 10	Reserved	0x00	resd	Kept at its default value.
Bit 9: 0	ADDR1	0x000	rw	Own address1 In 7-bit address mode, bit 0 and bit [9：8] don’t care.

11.5.4 Own address register2 (I2C_OADDR2)

Bit	Register	Reset value	Type	Description
Bit 15: 8	Reserved	0x00	resd	Kept at its default value.
Bit 7: 1	ADDR2	0x00	rw	Own address 2 7-bit address
Bit 0	ADDR2EN	0x0	rw	Own address 2 enable 0: In 7-bit address mode, only OADDR1 is recognized. 1: In 7-bit address mode, both OADDR1 and OADDR2 are recognized.

11.5.5 Data register (I2C_DT)

Bit	Register	Reset value	Type	Description
Bit 15: 8	Reserved	0x00	resd	Kept at its default value
Bit 7: 0	DT[7: 0]	0x00	rw	This field is used to store data received or to be transferred. Transmitter mode: Data transfer starts automatically when a byte is written to the DT register. Once the transfer starts (TDE=1), I^2C will keep a continuous data transfer flow if the next data to be transferred is written to the DT register in a timely manner. Receiver mode: Btyes received are copied into the DT register (RDNE=1). A continuous data transfer flow can be maintained if the DT register is read before the next word is received (RDNE=1). Note: If an ARLOST event occurs on ACK pulse, the received byte is not copied into the data register, so it cannot be read.

11.5.6 Status register1 (I2C_STS1)

Bit	Register	Reset value	Type	Description
Bit 15	ALERTF	0x0	rw0c	SMBus alert flag In SMBus host mode: 0: No SMBus alert 1: SMBus alert event is received. In SMBus slave mode: It indicates the receiving status of the default device address (0001100x) 0: Default device address is not received. 1: Default device address is received. This bit is cleared by software, or by hardware when I2CEN=0.
Bit 14	TMOUT	0x0	rw0c	SMBus timeout flag 0: No timeout error. 1: Timeout This bit is cleared by software, or by hardware when I2CEN=0. Note: This function is valid only in SMBUS mode.
Bit 13	Reserved	0x0	resd	Kept at its default value.
Bit 12	PECERR	0x0	rw0c	PEC receive error flag 0: No PEC error 1: PEC error occurs. This bit is cleared by software.
Bit 11	OUF	0x0	rw0c	Overload / underload flag In transmission mode: 0: Normal

				1: Underload In reception mode: 0: Normal 1: Overload This bit is cleared by software, or by hardware when I2CEN=0.
Bit 10	ACKFAIL	0x0	rw0c	Acknowledge failure flag 0: No acknowledge failure 1: Acknowledge failure occurs. Set by hardware when no acknowledge is returned. This bit is cleared by software, or by hardware when I2CEN=0.
Bit 9	ARLOST	0x0	rw0c	Arbitration lost flag 0: No arbitration lost is detected. 1: Arbitration lost is detected. This bit is cleared by software, or by hardware when I2CEN=0. On ARLOST even, the I^2C interface switches to slave mode automatically.
Bit 8	BUSERR	0x0	rw0c	Bus error flag 0: No Bus error occurs. 1: Bus error occurs. Set by hardware when the interface detects a misplaced Start or Stop condition. This bit is cleared by software, or by hardware when I2CEN=0.
Bit 7	TDBE	0x0	ro	Transmit data buffer empty flag 0: The data is being transferred from the DT register to the shift register (the data is still loaded with the data at this point.) 1: The data has been moved from the DT register to the shift register. The data register is empty now. This flag is set when the DT register is empty, and cleared when writing to the DT register. Note: The TDBE bit is not cleared by writing the first data to be transmitted, or by writing data when the TDC is set, since the data register is still empty at this time.
Bit 6	RDBF	0x0	ro	Receive data buffer full flag 0: Data register is empty. 1: Data register is full (data received) This flag is cleared when the DT register is read. The RDBF bit is not set at ARLOST event.
Bit 5	Reserved	0x0	resd	Kept at its default value.
Bit 4	STOPF	0x0	ro	Stop condition generation complete flag 0: No Stop condition is detected. 1: Stop condition is detected. This bit is set by hardware when a Stop condition is detected on the bus by the slave if ACKEN=1. It is cleared by reading STS1 register followed by writing to the CTRL1 register.
Bit 3	ADDRHF	0x0	ro	Master 9~8 bit address head match flag 0: Master 9~8 bit address head mismatch 1: Master 9~8 bit address head match Set by hardware when the first byte is sent by master in 10-bit address mode. Cleared by a write to the CTRL1 register after the STS1

				register is read by software, or by hardware when PEN=0. Note: The ADDR10 bit is not set after a NACK reception.
Bit 2	TDC	0x0	ro	Data transfer complete flag 0: Data transfer is not completed yet (the shift register still holds data) 1: Data transfer is completed (shift register is empty) This bit is cleared automatically by read or write access to the DT reginser, or when a Start or Stop condition is received. When STRETCH=0 In reception mode, when a new byte (including ACK pulse) is received and the data register is not read yet (RDBF=1) In transmission mode, when a new byte is sent and the data register is not written yet (TDBE=1) The TDC is set under both conditions.
Bit 1	ADDR7F	0x0	ro	0~7 bit address match flag 0: Address is not sent in host ode or received in slave mode 1: Address is sent in host mode or address is received in slave mode. Cleared by read access to STS2 register after the software reads STS1 register. Note: the ADDR7F bit is not set after a NACK reception.
Bit 0	STARTF	0x0	ro	Start condition generation complete flag 0: No Start condition is generated. 1: Start condition is generated. Cleared by write access to the DT register after the software reads the STS1 register.

11.5.7 Status register2 (I2C_STS2)

Bit	Register	Reset value	Type	Description
Bit 15: 8	PECVAL	0x00	ro	PEC value Cleared when PECEN is reset.
Bit 7	ADDR2F	0x0	ro	Received address 2 flag 0: Received address matches the contents of OADDR1 1: Received address matches the contents of OADDR2 Cleared when a Stop/Start condition is received, or by hardware when I2CEN=0.
Bit 6	HOSTADDRF	0x0	ro	SMBus host address reception flag 0: SMBus host address is not received. 1: SMBus host address is received. Cleared when a Stop/Start condition is received, or by hardware when I2CEN=0.
Bit 5	DEVADDRF	0x0	ro	SMBus device address reception flag 0: SMBus device address is not received. 1: SMBus device address is received. Cleared when a Stop/Start condition is received, or by hardware when I2CEN=0.
Bit 4	GCADDRF	0x0	ro	General call address reception flag 0: General call address is not received. 1: General call address is received. Cleared when a Stop/Start condition is received, or by hardware when I2CEN=0.
Bit 3	Reserved	0x0	resd	Keep at its default value.
Bit 2	DIRF	0x0	ro	Transmission direction flag

				0: Data reception 1: Data transmission Cleared by hardware when a Stop condition is received.
Bit 1	BUSYF	0x0	ro	Bus busy flag transmission mode 0: Bus idle 1: Bus busy Set by hardware on detection of SDA/SCL low, and cleared by hardware on detection of a Stop condition.
Bit 0	TRMODE	0x0	ro	Transmission mode 0: Slave mode 1: Master mode Set by hardware when the GENSTART is set and a Start condition is sent. Cleared by hardware when a Stop condition is detected.

11.5.8 Clock control register (I2C_ CLKCTRL)

Bit	Register	Reset value	Type	Description
Bit 15	SPEEDMODE	0x0	rw	Speed mode selection 0: Standard mode (up to 100 kHz) 1: Fast mode (up to 400 kHz) In fast mode, an accurate 400kHz clock is generated when the I^2C clock frequency is an integer multiple of 10MHz.
Bit 14	DUTYMODE	0x0	rw	Fast mode duty cycle 0: The ratio of High to low is 1:2. 1: The ratio of low to high is 9:16.
Bit 13: 12	Reserved	0x0	resd	Kept at its default value.
Bit 11: 0	SPEED	0x000	rw	I^2C bus speed config In standard mode: High level= SPEED x T_{I2C_CLK} Low level= SPEED x T_{I2C_CLK} In fast mode: DUTYMODE = 0: High level= SPEED x T_{I2C_CLK} x 1 Low level= SPEED x T_{I2C_CLK} x 2 DUTYMODE = 1: High level= SPEED x T_{I2C_CLK} x 9 Low level= SPEED x T_{I2C_CLK} x 16 The minimum value allowed in standard mode is 4. In fast mode, the minimum value allowed is 1. The CLKCTRL register can be configured only when the I2C is disabled (I2CEN=0).

Note: The CLKCTRL register can be configured only when the I2C is disabled (I2CEN=0).

11.5.9 Clock rise time register (I2C_TMRISE)

Bit	Register	Reset value	Type	Description
Bit 15: 6	Reserved	0x000	resd	Forced to 0 by hardware.
Bit 5: 0	RISETIME	0x02	rw	I2C bus rise time Time= RISETIME x T_{I2C_CLK} In standard mode, I2C protocol stand is 1000ns, and the formula as follows: RISETIME = F_{I2C_CLK} +1 For example, when I2C clock is 48MHz, RISETIME = 48+1 In fast mode, I2C protocol stand is 300ns, and the formula as follows: RISETIME = F_{I2C_CLK} x0.3+1 For example, when I2C clock is 48MHz, RISETIME = 48x0.3+1 Note: RISETIME[5 : 0] can be configured only when I2CEN=0.

12 Universal synchronous/asynchronous receiver/transmitter (USART)

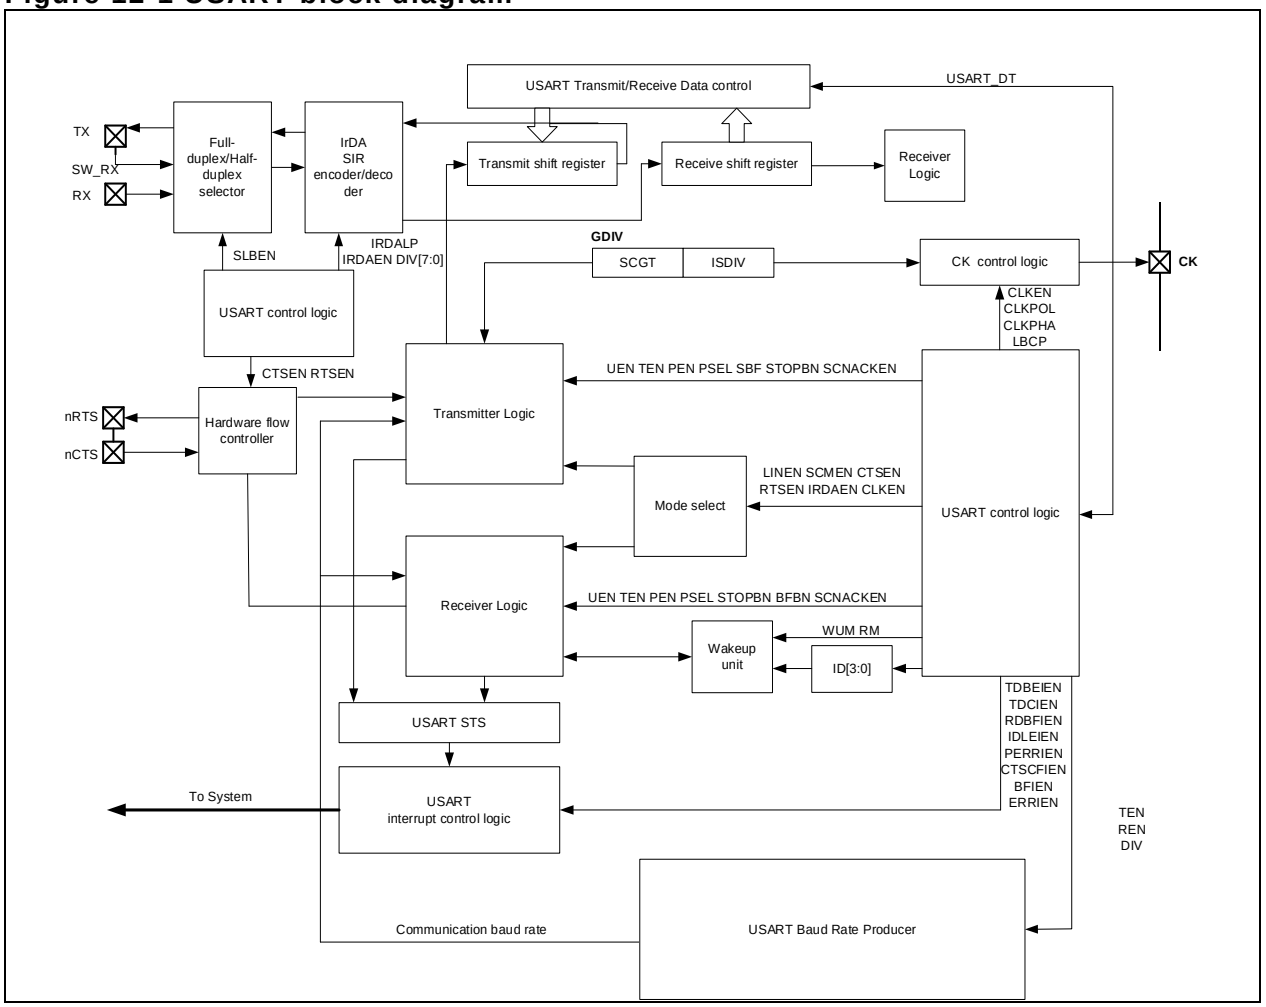
12.1 USART introduction

The universal synchronous/asynchronous receiver/transmitter (USART) serves an interface for communication by means of various configuration and peripherals with different data formats. It supports asynchronous full-duplex and half-duplex as well as synchronous transfer. With a programmable baud rate generator, USART offers up to 6.25 MBits/s of baud rate by setting the system frequency and frequency divider. The users can also configure the required communication frequency by configuring the system clock and frequency divider.

In addition to standard NRZ asynchronous and synchronous receiver/transmitter communication protocols, USART also supports widely-used serial communication protocols such as LIN (Local Interconnection Network), IrDA (Infrared Data Association) SIRENDEC specification, Asynchronous SmartCard protcoal defined in ISO7816-3 standard, and CTS/RTS (Clear To Send/Request To Send) hardware flow operation.

It also allows mutli-processor communication, and supports silent mode waken up by idle frames or ID matching to build up a USART network. Meanwhile, high-speed communication is possible by using DMA.

Figure 12-1 USART block diagram



USART main features:

- Programmable full-duplex or half-duplex communication
  - Full-duplex, asynchronous communication

- Half-duplex, single communication

- Programmable communication modes
  - NRZ standard format (Mark/Space)
  - LIN (Local Interconnection Network):
  - IrDA SIR:
  - Asynchronous SmartCard protocol defined in ISO7816-3 standard: Support 0.5 or 1.5 stop bits in Smartcard mode
  - RS-232 CTS/RTS (Clear To Send/Request To Send) hardware flow operation
  - Multi-processor communication with silent mode (waken up by configuraing ID match and bus idle frame)
  - Synchronous mode
- Programmable baud rate generator
  - Shared by transmission and reception, up to 7.5 MBits/s
- Programmable frame format
  - Programmable data word length (8 bits or 9 bits)
  - Programmable stop bits-support 1 or 2 stop bits
  - Programmable parity control: transmitter with parity bit transmission capability, and receiver with received data parity check capability
- Programmable DMA multi-processor communication
- Programmable separate enable bits for transmitter and receiver
- Programmable output CLK phase, polarity and frequency
- Detection flags
  - Receive buffer full
  - Transmit buffer empty
  - Transfer complete flag
- Four error detection flags
  - Overrun error
  - Noise error
  - Framing error
  - Parity error
- Programmable 10 interrupt sources with flags
  - CTSF changes
  - LIN break detection
  - Transmit data register empty
  - Transmission complete
  - Receive data register full
  - Idle bus detected
  - Overrun error
  - Framing error
  - Noise error
  - Parity error

12.2 Full-duplex/half-duplex selector

The full-duplex and half-duplex selector enables USART to perform data exchanges with peripherals in full-duplex or half-duplex mode, which is achieved by setting the corresponding registers.

In two-wire unindirectional full-duplex mode (by default), TX pin is used for data output, while the RX pin is used for data input. Since the transmitter and receiver are independent of each other, USART is allowed to send/receive data at the same time so as to achieve full-duplex communication.

When the HALFSEL is set to 1, the single-wire bidirectional half-duplex mode is selected for communication. In this case, the LINEN, CLKEN, SCMEN and IRDAEN bits must be set 0. RX pin is inactive, while TX and SW_RX are interconnected inside the USART. For the USART part, TX pins is used for data output, and SW_RX for data input. For the peripheral part, bidirectional data transfer is executed through IO mapped by TX pin.

12.3 Mode selector

12.3.1 Introduction

USART mode selector allows USART to work in different operation modes through software configuration so as to enable data exchanges between USART and peripherals with different communication protocols.

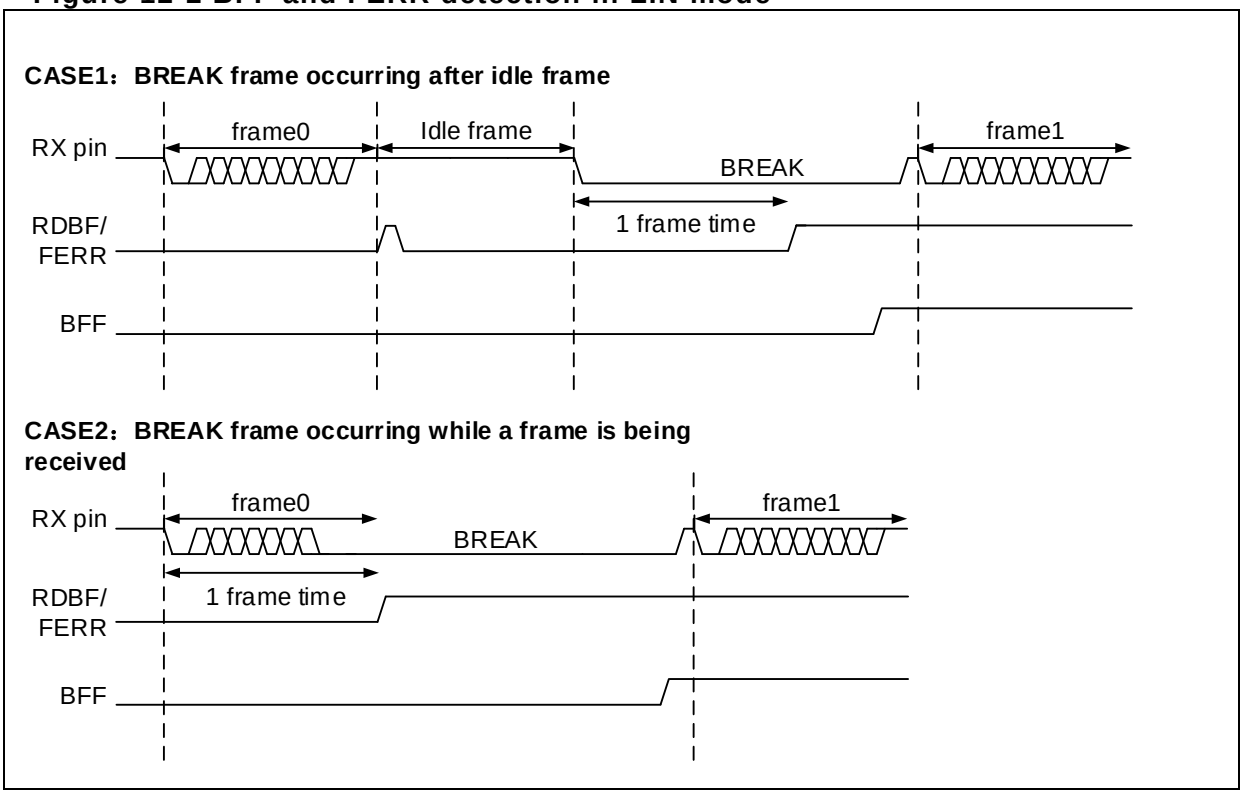
USART supports NRZ standard format (Mark/Space), by default. It also supports LIN (Local Interconnection Network), IrDA SIR (Serial Infrared), Asynchronous Smartcard protocol in ISO7816-3 standard, RS-232 CTS/RTS (Clear To Send/Request To Send) hardware flow operation, silent mode and synchronous mode, depending on USART mode selection configuration.

12.3.2 Configuration procedure

Selection of operation mode is done by following the configuration process listed below. In addition, such configuration method, along with that of receiver and transmitter described in the subsequent sections, are used to make USART initialization configuration.

1. **LIN mode:**
   Parameters configuration: LINEN=1, CLKEN=0, STOPBN[1: 0]=0, SCMEN=0, SLHDEN=0, IRDAEN=0 and DBN=0.
   LIN master has break fram transmission capability, and thus it is able to send 13-bit low-level LIN synchronous break frame by setting SBF=1.
   Similarily, LIN slave has break frame detection capability, and thus it is able to detect 11-bit or 10-bit break fame, depending on whether BFBN=1 or BFBN=0.

Figure 12-2 BFF and FERR detection in LIN mode



2. **Smartcard mode:**

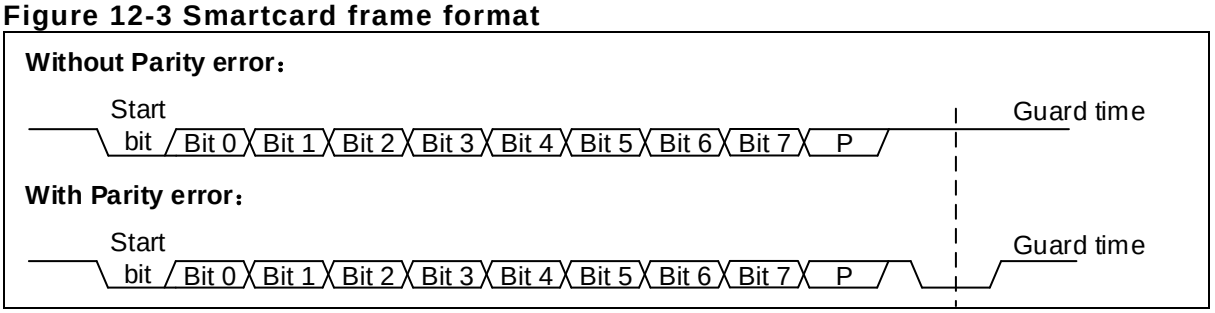
Parameters configuration: SCMEN=1, LINEN=0, SLHDEN=0, IRDAEN=0, CLKEN=1, DBN=1, PEN=1, and STOPBN[1: 0]=11.

The polarity, phase and pulse number of the clock can be configured by setting the CLKPOL, CLKPHA and LBCP bits (Refer to Synchronous mode for details).

The assertion of the TDC flag can be delayed by setting the SCGT[7: 0] bit (guard time bit). The TDF bit can be asserted high after the guard time counter reaches the value programmed in the SCGT[7: 0] bit.

The Smartcard is a single-wire half duplex communication protocol. The SCNACKEN bit is used to select whether to send NACK when a parity error occurs. This is to indicate to the Smarcard that the data has not been correctly received

Figure 12-3 Smartcard frame format

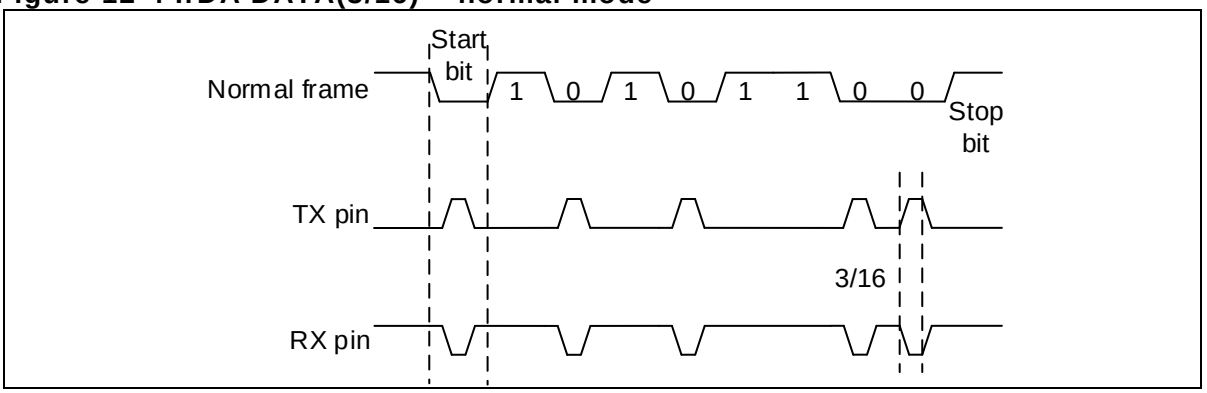


3. **Infrared mode:**

Parameters configuration: IRDAEN=1, CLKEN=0, STOPBN[1: 0]=0, SCMEN=0 and SLHDEN=0.

The infrared low-power mode can be enabled by setting IRDALP=1. In normal mode the transmitted pulse width is specified as 3/16 bit. In infrared low-power mode, the pulse width can be configurable. And the ISDIV[7:0] bit can be used to achieve the desired low-power frequency.

Figure 12-4 IrDA DATA(3/16) – normal mode



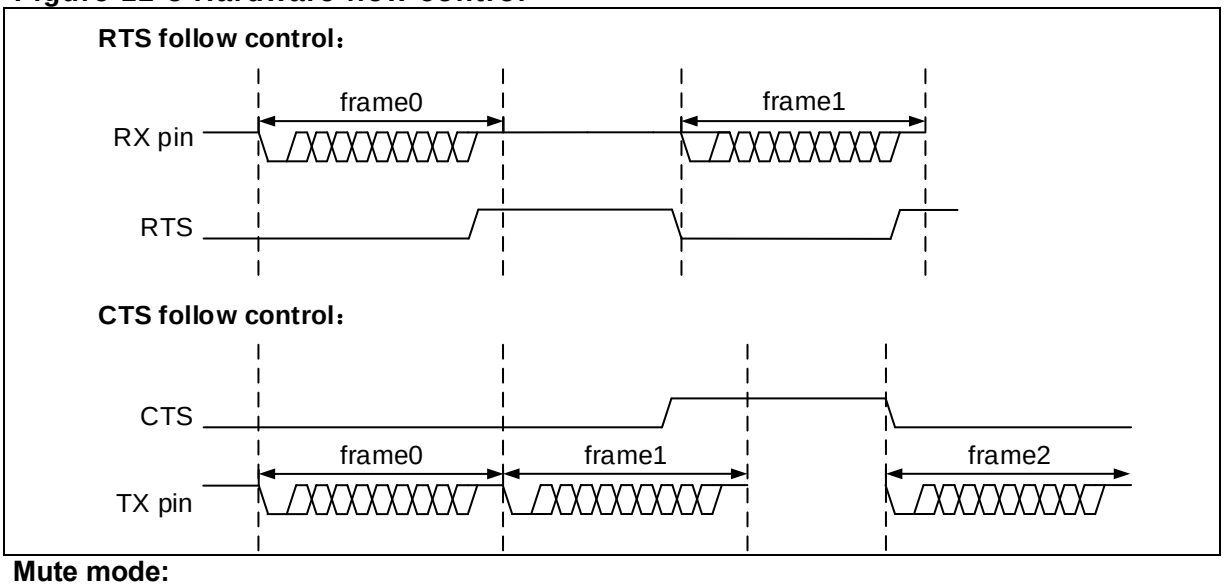
4. **Hardware flow control mode:**

RTS and CTS flow control can be enabled by setting RTSEN=1 and CTSEN=1, respectively. This is to control serial data flow between two devices.

RTS: the RTS becomes active (pull-down means low) as soon as the USART receiver is ready to receive a data. When the data has arrived (starts at each STOP bit) in the receive register, the RTS bit is set, indicating request to stop data transfer at the end of current frame.

CTS: the USART transmitter checks the CTS input before sending next frame. The next data is sent if CTS is active (when low); if CTS becomes inactive (when hihg) during transmission, it stops sending at the end of current transfer.

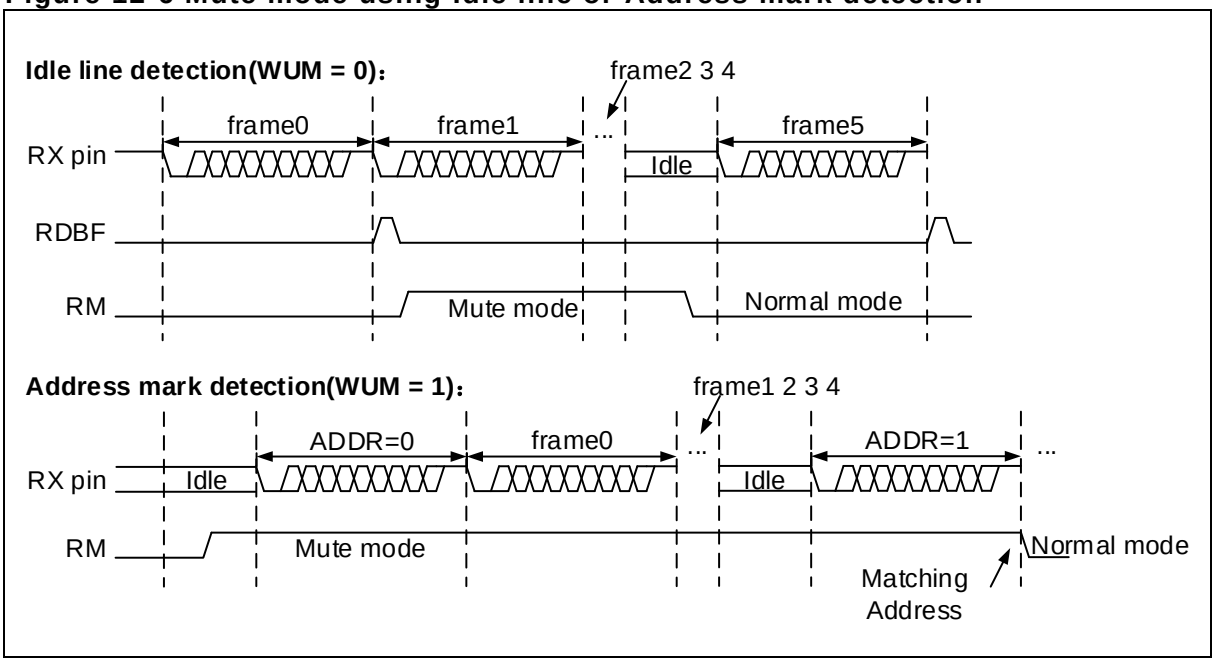
Figure 12-5 Hardware flow control



5. **Mute mode:**

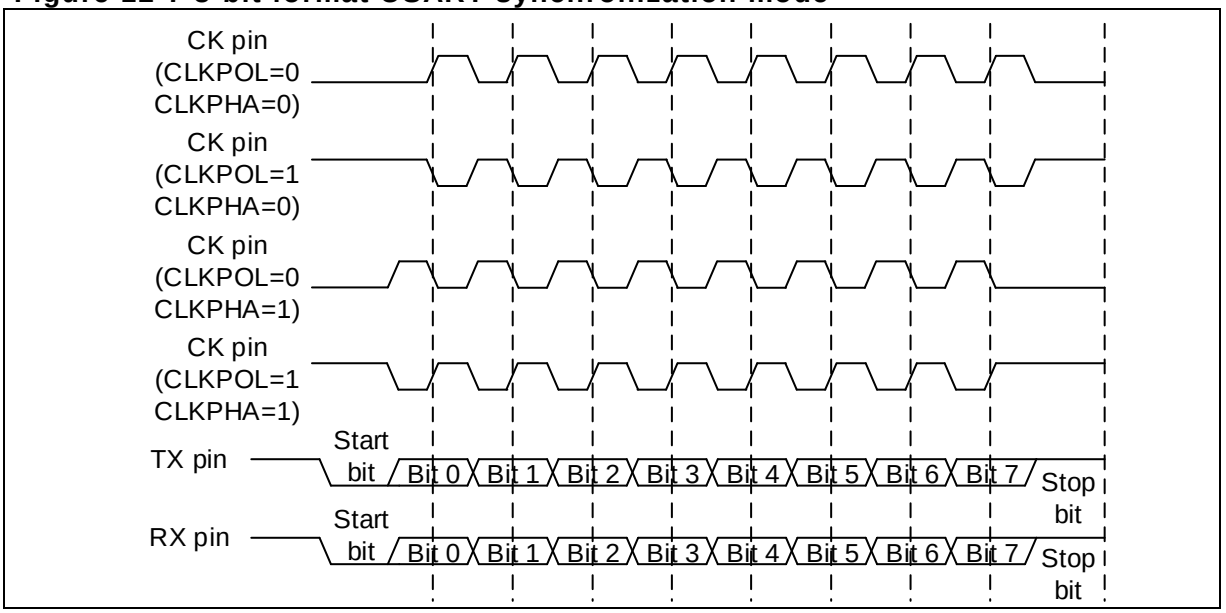
Mute mode can be entered by setting RM=1. It is possible to wake up from silent mode by setting WUM=1 (ID match) and WUM=0 (idle bus), respectively. The ID[3: 0] is configurable. When ID match is selected, if the MSB of data bit is set to 1, it indicates that the current data is ID, and the four LSB represent ID value.

Figure 12-6 Mute mode using Idle line or Address mark detection



6. **Synchronous mode:**
By setting the CLKEN bit to 1, synchronous mode and clock pin output are enabled. Select CK pin high or low in idle state by setting the CLKPOL bit (1 or 0). Whether to sample data on the second or the first edge of the clock depends on the CLKPHA bit (1 or 0). The LBCP bit (1 or 0) is used to select whether to output clock on the last data bit. And the ISDIV[4: 0] is used to select the required clock output frequency.

Figure 12-7 8-bit format USART synchronization mode



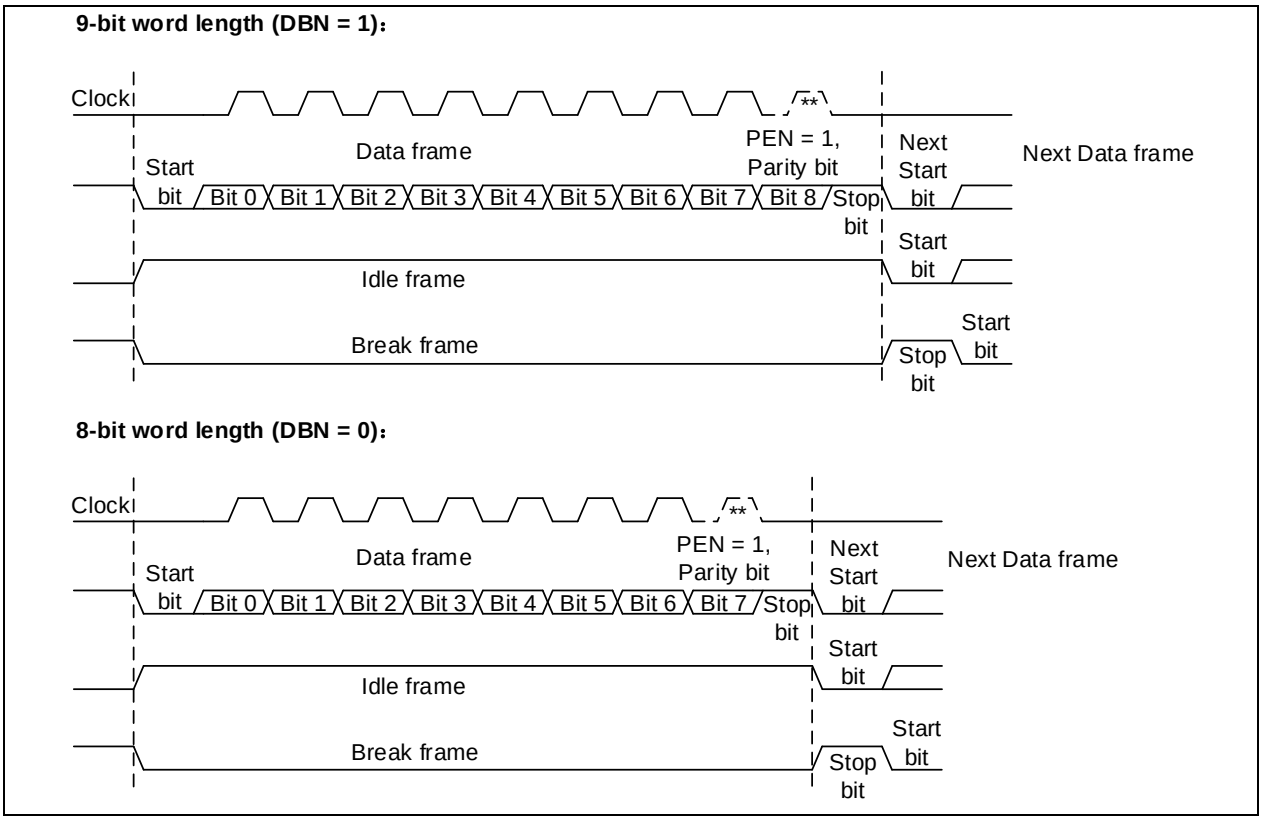
12.4 USART frame format and configuration

USART data frame consists of start bit, data bit and stop bit, with the last data bit being as a parity bit.

USART idle frame size is equal to that of the data frame under current configuration, but all bits are 1.

USART break frame size is the current data frame size plus its stop bit. All bits before the stop bit are 0. The DBN bit is used to program 8-bit (DBN=0) or 9-bit (DBN=1) data bits.

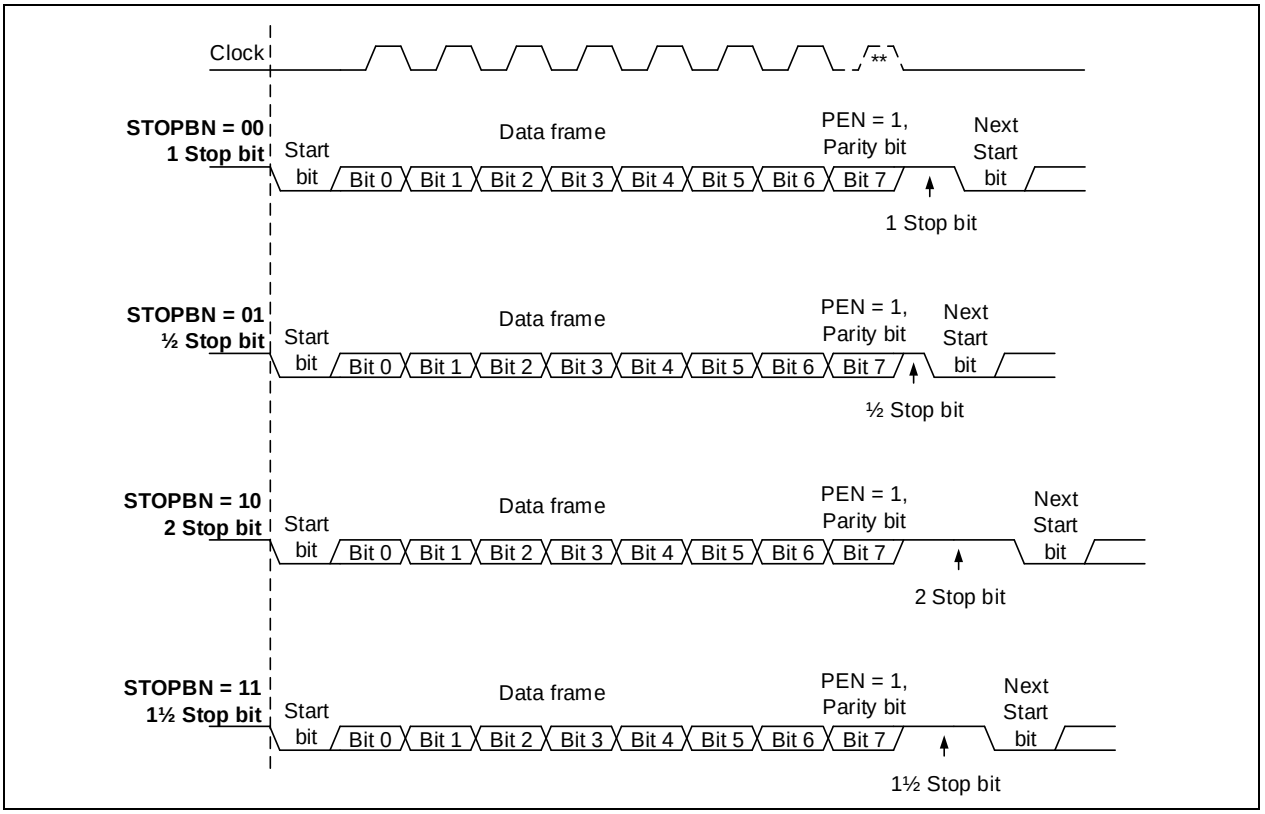
Figure 12-8 Word length



The STOPBN bit is used to program one bit (STOPBN=00), 0.5-bit (STOPBN=01), two-bit (STOPBN=10) and 1.5-bit (STOPBN=11) stop bits.

Set the PEN bit will enable parity control. PSEL=1 indicates Odd parity, while PSEL=0 for Even parity. Once the parity control is enabled, the MSB of the data bit will be replaced with parity bit, that is, the valid data bits are reduced by one bit.

Figure 12-9 Stop bit configuration



12.5 DMA transfer introduction

Enable transmit data buffer and receive data buffer using DMA to achieve continuous high-speed transmission for USART, which is detailed in subsequent sections. For more information on specific DMA configuration, refer to DMA chapter.

12.5.1 Transmission using DMA

1. Select a DMA channel: Select a DMA channel from DMA channel map table described in DMA chapter.
2. Configure the destination of DMA transfer: Configure the USART_DT register address as the destination address bit of DMA transfer in the DMA control register. Datat will be sent to this address after transmit request is received by DMA.
3. Configure the source of DMA transfer: Configure the memory address as the source of DMA transfer in the DMA control register. Data will be loaded into the USART_DT register from the memory address after transmit request is received by DMA.
4. Configure the total number of bytes to be transferred in the DMA control register.
5. Configure the channel priority of DMA transfer in the DMA control register.
6. Configure DMA interrupt generation after half or full transfer in the DMA control register.
7. Enable DMA transfer channel in the DMA control register.

12.5.2 Reception using DMA

1. Select a DMA transfer channel: Select a DMA channel from DMA channel map table described in DMA chapter.
2. Configure the destination of DMA transfer: Configure the memory address as the destination of DMA transfer in the DMA control register. Data will be loaded from the USART_DT register to the programmed destination after reception request is received by DMA.
3. Configure the source of DMA transfer: Configure the USART_DT register address as the source of DMA transfer in the DMA control register. Data will be loaded from the USART_DT register to the programmed destination after reception request is received by DMA.
4. Configure the total number of bytes to be transferred in the DMA control register.
5. Configure the channel priority of DMA transfer in the DMA control register.
6. Configure DMA interrupt generation after half or full transfer in the DMA control register.
7. Enable a DMA transfer channel in the DMA control register.

12.6 Baud rate generation

12.6.1 Introduction

USART baud rate generator uses an internal counter based on PCLK. The DIV (USART_BAUDR [15:0] register) represents the overflow value of the counter. Each time the counter is full, it denotes one-bit data. Thus each data bit width refers to PCLK cycles x DIV.

The receiver and transmitter of USART share the same baud rate generator, and the receiver splits each data bit into 16 equal parts to achieve oversampling, so the data bit width should not be less than 16 PCLK periods, that is, the DIV value must be equal to or be greater than 16.

12.6.2 Configuration

User can program the desired baud rate by setting different system clocks and writing different values into the USART_BAUDR register. The calculation format is as follows:

$$\frac{\text{TX}}{\text{RX}} baud\ \ rate = \frac{f_{CK}}{\text{DIV}}$$

Where, f_{CK} refers to the system clock of USART (i.e. PCLK1/PCLK2)

Note: 1. Write access to the USART_BAUDR register before UEN. The baud rate register value should not be altered when UEN=1.

2. When USART receiver or transmitter is disabled, the internal counter will be reset, and baud rate interrupt will occur.

Table 12-1 Error calculation for programmed baud rate

Baud		fPCLK=36MHz			fPCLK=72MHz		
No.	Kbps	Actual	Value programmed in the baud register	Error%	Actual	Value programmed in the baud register	Error%
1	2.4	2.4	15000	0%	2.4	30000	0%
2	9.6	9.6	3750	0%	9.6	7500	0%
3	19.2	19.2	1875	0%	19.2	3750	0%
4	57.6	57.6	625	0%	57.6	1250	0%
5	115.2	115.384	312	0.15 %	115.2	625	0%
6	230.4	230.769	156	0.16 %	230.769	312	0.16 %
7	460.8	461.538	78	0.16 %	461.538	156	0.16 %
8	921.6	923.076	39	0.16 %	923.076	78	0.16 %
9	2250	2250	16	0%	2250	32	0%
10	4500	NA			4500	16	0%

Taking a baud rate of 115.2Kbps as an example, if fPCLK=36MHz, the value in the baud register should be set to 312(0x38). Based on formula, the calculated baud rate (acutal) is 36000000 / 312 = 115384 = 115.384Kbps. The % error between the desired and actual value is calculated based on the formula: (Calculated actual result-Desired)/desired baud rate*100%, that is, (115.384 - 115.2) / 115.2 * 100% = 0.15%.

12.7 Transmitter

12.7.1 Transmitter introduction

USART transmitter has its individual TEN control bit. The transmitter and receiver share the same baud rate that is programmable. There is a transmit data buffer (TDR) and a transmit shift register in the USART. The TDBE bit is set whenever the TDR is empty, and an interrupt is generated if the TDBEIEN is set.

The data written by software is stored in the TDR register. When the shift register is empty, the data will be moved from the TDR register to the shift register so that the data in the transmit shift register is output on the TX pin in LSB mode. The output format depends on the programmed frame format.

If synchronous transfer or clock output is selected, the clock pulse is output on the CK pin. If the hardware flow control is selected, the control signal is input on the CTS pin.

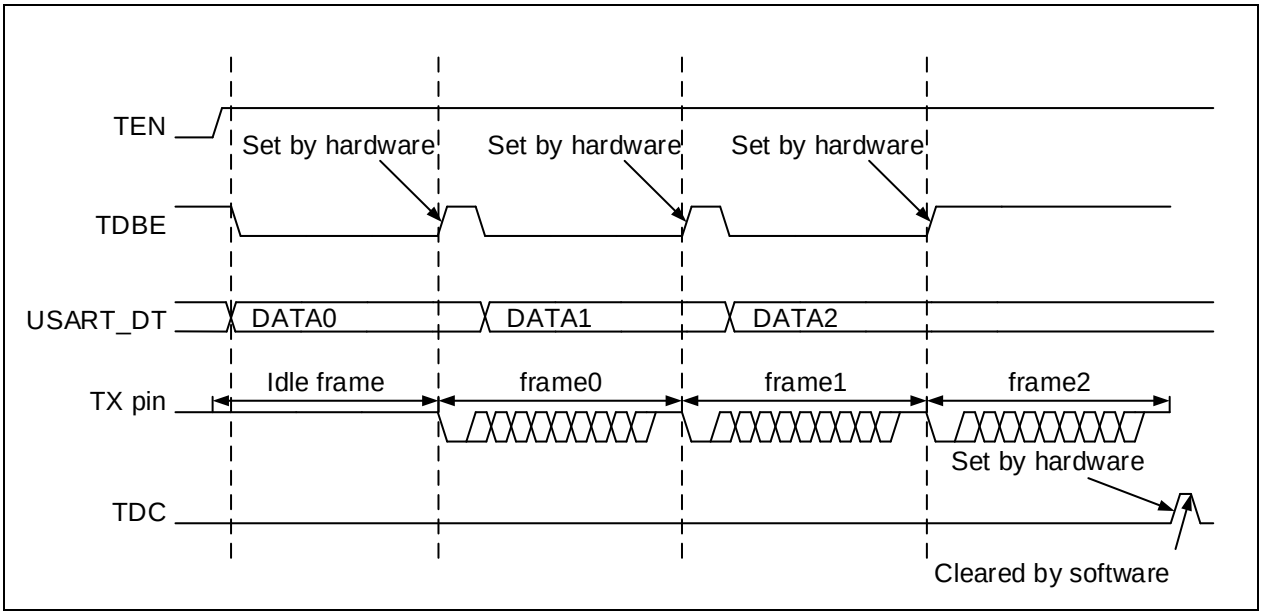
Note: 1. The TEN bit cannot be reset during data transfer, or the data on the TX pin will be corrupted.

2. After the TEN bit is enabled, the USART will automatically send an idle frame.

12.7.2 Transmitter configuration

1. USART enable: Set the UEN bit.
2. Full-duplex/half-duplex configuration: Refer to *12.2 Full-duplex/half-duplex selector*.
3. Mode configuration: Refer to *12.3 Mode selector*.
4. Frame format configuration: Refer to *12.4 USART frame format and configuration*.
5. Interrupt configuration: Refer to *12.9 Interrupt requests*.
6. DMA transmission configuration: If the DMA mode is selected, the DMATEN bit (bit 3 in the USART_CTRL3register) is set, and configure DMA register accordingly.
7. Baud rate configuration: Refer to *12.6 Baud rate generation*.
8. Transmitter enable: When the TEN bit is set, the USART transmitter will send an idle frame.
9. Write operation: Wait unitl the TDBE bit is set, the data to be transferred will be loaded into the USART_DT register (This operatin will clear the TDBE bit). Repeat this step in non-DMA mode.
10. After the last data expected to be transferred is written, wait until the TDC is set, indicating the end of transfer. The USART cannot be disabled before the flag is set, or transfer error will occur.
11. When TDC=1, read access to the USART_STS register and write access to the USART_DT register will clear the TDC bit; This bit can also be cleared by writing “0”, but this is valid only in DMA mode.

Figure 12-10 TDC/TDBE behavior when transmitting



12.8 Receiver

12.8.1 Receiver introduction

USART receiver has its individual REN control bit (bit 2 in the USART_CTRL1 register). The transmitter and receiver share the same baud rate that is programmable. There is a receive data buffer (RDR) and a receive shift register in the USART.

The data is input on the RX pin of the USART. When a valid start bit is detected, the receiver ports the data received into the receive shift register in LSB mode. After a full data frame is received, based on the programmed frame format, it will be moved from the receive shift register to the receive data buffer, and the RDBF is set accordingly. An interrupt is generated if the RDBFIEN is set.

If hardware flow control is selected, the control signal is output on the RTS pin.

During data reception, the USART receiver will detect whether there are errors to occur, including framing error, overrun error, parity check error or noise error, depending on software configuration, and whether there are interrupts to generate using the interrupt enable bits.

12.8.2 Receiver configuration

Configuration procedure:

1. USART enalbe: UEN bit is set.
2. Full-duplex/half-duplex configuration: Refer to *12.2 Full-duplex/half-duplex selector*.
3. Mode configuration: Refer to *12.3 Mode selector*.
4. Frame format configuration: Refer to *12.4 USART frame format and configuration*.
5. Interrupt configuration: Refer to *12.9 Interrupt requests*.
6. Reception using DMA: If the DMA mode is selected, the DMAREN bit is set, and configure DMA register accordingly.
7. Baud rate configuration: Refer to *12.6 Baud rate generation*..
8. Receiver enable: REN bit is set.

Character repeption:

- The RDBF bit is set. It indicates that the content of the shift register is transferred to the RDR (Receiver Data Register). In other words, data is received and can be read (including its associated error flags)
- An interrupt is generated when the RDBFIEN is set.
- The erro flag is set when a framing error, noise error or overrun error is detected during reception.
- In DMA mode, the RDBF bit is set after every byte is received, and it is cleared when the data register is read by DMA.
- In non-DMA mode, the RDBF bit is cleared when read access to the USART_DT register by software. The RDBF flag can also be cleared by writing 0 to it. The RDBF bit must be cleared before the end of next frame reception to avoid overrun error.

Break frame reception:

- Non-LIN mode: It is handled as a framing error, and the FERR is set. An interrupt is generated if the corresponding interrupt bit is enabled. Refer to framing error decribed below for details.
- LIN mode: It is handled as a break frame, and the BFF bit is set. An interrupt is generated if the BFIEN is set.

Idle frame reception:

- It is handled as a data frame, and the IDLEF bit is set. An interrupt is generated if the IDLEIEN is set.

When a framing error occurs:

- The FERR bit is set.
- The USART receiver moves the invalid data from the receive shift register to the receive data buffer.
- In non-DMA mode, both FERR and RDBF are set at the same time. The latter will generate an interrupt. In DMA mode, an interrupt is generated if the ERRIEN.

When an overrun error occurs:

- The ROERR bit is set.
- The data in the receive data buffer is not lost. The previous data is still available when the USART_DT register is read.
- The content in the receive shift register is overwritten.Afterwards, any data received will be lost.
- An interrupt is generated if the RDBFIEN is set or both ERRIEN and DMAREN are set.

- The ROERR bit is cleared by reading the USART_STS register and then USART_DT register in order.

Note: If ROERR is set, it indicates that at least one piece of data is lost, with two possibilities:

If RDBF=1, it indicates that the last valid data is still stored in the receive data buffer, and can be read.

If RDBF=0, it indicates that the last valid data in the receive data buffer has already been read.

Note: The REN bit cannot be reset during data reception, or the byte that is currently being received will be lost.

12.8.3 Start bit and noise detection

A start bit detection occurs when the REN bit is set. With the oversampling techniques, the USART receiver samples data on the 3rd, 5th, 7th, 8th, 9th and 10th bits to detect the valid start bit and noise. *Table 12-2* shows the data sampling over start bit and noise detection.

Table 12-2 Data sampling over start bit and noise detection

Sampled value (3·5·7)	Sampled value (8·9·10)	NERR bit	Start bit validity
000	000	0	Valid
001/010/100	001/010/100	1	Valid
001/010/100	000	1	Valid
000	001/010/100	1	Valid
111/110/101/011	Any value	0	Invalid
Any value	111/110/101/011	0	Invalid

Note: If the sampling values on the 3rd, 5th, 7th, 8th, 9th, and 10th bits do not match the above mentioned requirements, the USART receiver does not think that a correct start bit is received, and thus it will abort the start bit detection and return to idle state waiting for a falling edge.

The USART receiver has the ability to detect noise. In the non-synchronous mode, the USART receiver samples data on the 7th, 8th and 9th bits, with its oversampling techniques, to distinguish valid data input from noise based on different sampling values, and recover data as well as set NERR (Noise Error Flag) bit.

Table 12-3 Data sampling over valid data and noise detection

Sampled value	NERR bit	Received bit value	Data validity
000	0	0	Valid
001	1	0	Invalid
010	1	0	Invalid
011	1	1	Invalid
100	1	0	Invalid
101	1	1	Invalid
110	1	1	Invalid
111	0	1	Valid

USART is able to receive data under the maximum allowable deviation condition. Its value depends on the DBN bit of the USART_CTRL1 register and the DIV[3: 0] of the USART_BAUDR register.

Note: The maximum allowable deviations stated in the table below are calculated based on 115.2Kbps. The actual deviations may vary with the settings of buad rate. In other words, the greater the buad rate is, the smaller the maximum allowable deviation; in contrast, when the baud rate gets smaller, the maximum allowable deviation will get bigger.

Table 12-4 Maximum allowable deviation

DBN	DIV[3:0] = 0	DIV[3:0] != 0
0	3.75%	3.33%
1	3.41%	3.03%

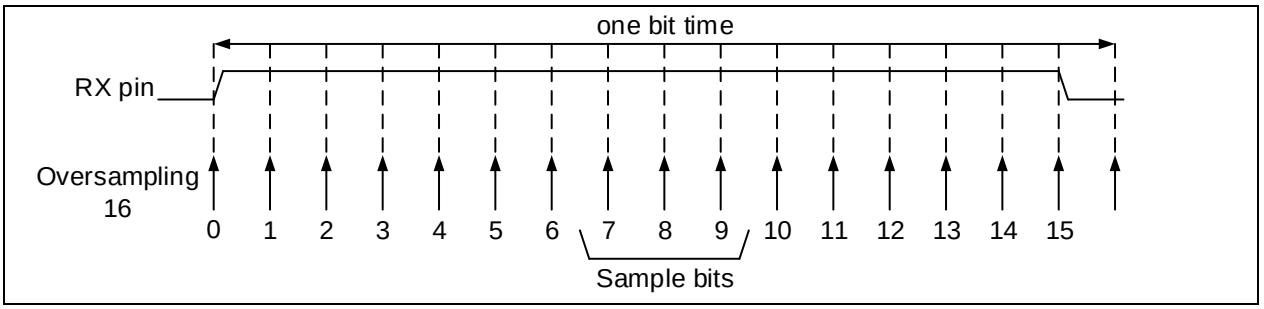
When noise is detected in a data frame:

- The NERR bit is set at the same time as the RDBF bit
- The invalid data is transferred from the receive shift register to the receive data buffer.

- No interrupt is generated in non-DMA mode. However, since the NERR bit is set at the same time as the RDBF bit, the RDBF bit will generae an interrupt. In DMA mode, an interrupt will be issued if the ERRIEN is set.

  The NERR bit is cleared by reading USART_STS register and then the USART_DT register.

Figure 12-11 Data sampling for noise detection



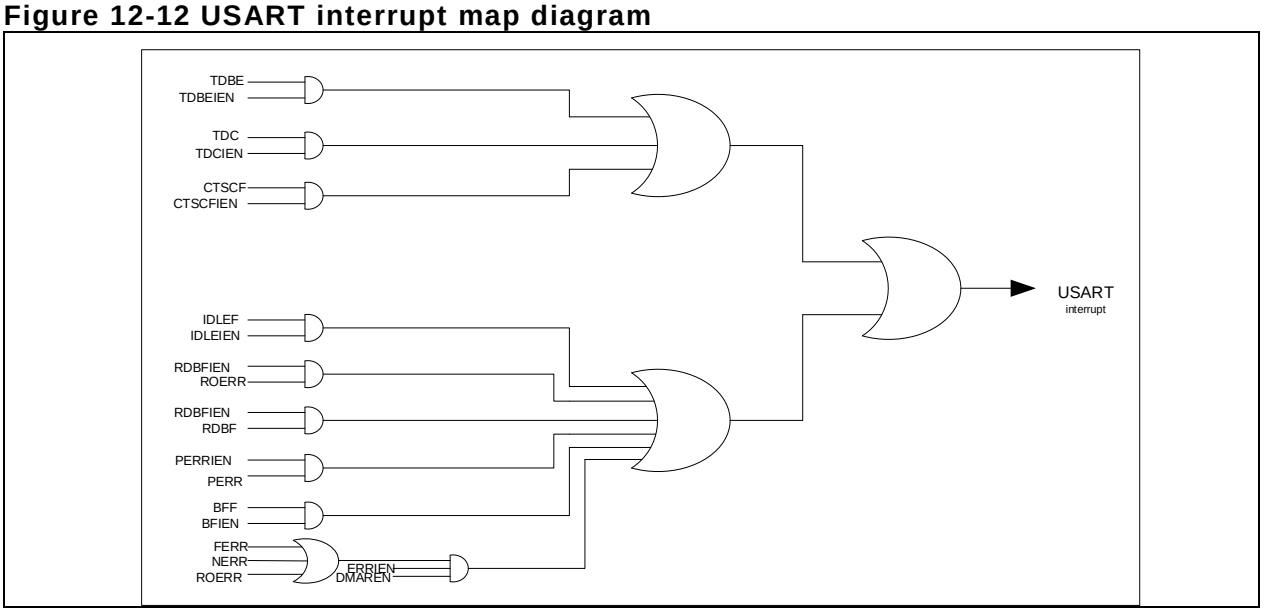
12.9 Interrupt requests

USART interrupt generator is the control center of USART interrupts. It is used to monitor the interrupt source inside the USART in real time and the generation of interrupts according to the programmed interrupt control bits. Table 12-3 shows the USART interrupt source and interrupt enable control bit. An interrupt will be generated over an event when the corresponding interrupt enable bit is set.

Table 12-5 USART interrupt request

Interrupt event	Event flag	Enable bit
Transmit data register empty	TDBE	TDBEIEN
CTS flag	CTSCF	CTSCFIEN
Transmit data complete	TDC	TDCIEN
Receive data buffer full	RDBF	RDBFIEN
Receiver overflow error	ROERR	
Idle flag	IDLEF	IDLEIEN
Parity error	PERR	PERRIEN
Break frame flag	BFF	BFIEN
Noise error, overflow error or framing error	NERR or ROERR or FERR	ERRIEN (1)

Figure 12-12 USART interrupt map diagram



12.10 I/O pin control

The following five interfaces are used for USART communication.

RX: Serial data input.

TX: Serial data output. In single-wire half-duplex and Smartcard mode, the TX pin is used as an I/O for data transmission and reception.

CK: Transmitter clock output. The output CLK phase, polarity and frequency can be programmable.
CTS: Transmitter input. Send enable signal in hardware flow control mode.
RTS: Receiver output. Send request signal in hardware flow control mode.

12.11 USART registers

Table 12-6 USART register map and reset values

Register	Offset	Reset value
USART_STS	0x00	0x0000 00C0
USART_DT	0x04	0x0000 0000
USART_BAUDR	0x08	0x0000 0000
USART_CTRL1	0x0C	0x0000 0000
USART_CTRL2	0x10	0x0000 0000
USART_CTRL3	0x14	0x0000 0000
USART_GTP	0x18	0x0000 0000

12.11.1 Status register (USART_STS)

Bit	Register	Reset value	Type	Description
Bit 31: 10	Reserved	0x000000	resd	Forced to be 0 by hardware.
Bit 9	CTSCF	0x0	rw0c	CTS change flag This bit is set by hardware when the CTS status line changes. It is cleared by software. 0: No change on the CTS status line 1: A change occurs on the CTS status line.
Bit 8	BFF	0x0	rw0c	Break frame flag This bit is set by hardware when a break frame is detected. It is cleared by software. 0: Break frame is not detected. 1: Break frame is detected.
Bit 7	TDBE	0x1	ro	Transmit data buffer empty This bit is set by hardware when the transmit data buffer is empty. It is cleared by a USART_DT register write operation. 0: Data is not transferred to the shift register. 1: Data is transferred to the shift register.
Bit 6	TDC	0x1	rw0c	Transmit data complete This bit is set by hardware at the end of transmission. It is cleared by software. (Option 1: read access to USART_STS register followed by a USART_DT write operation; Option 2: Write “0” to this bit) 0: Transmission is not completed. 1: Transmission is completed.
Bit 5	RDBF	0x0	rw0c	Receive data buffer full This bit is set by hardware when the data is transferred from the shift register to the USART_DT register. It is cleared by software. (Option 1: read USART_DT register; Option 2: write “0” to this bit) 0: Data is not received. 1: Data is received.
Bit 4	IDLEF	0x0	ro	Idle flag This bit is set by hardware when an idle line is detected. It is cleared by software. (Read USART_DT register followed by a USART_DT read operation) 0: No idle line is detected. 1: Idle line is detected.
Bit 3	ROERR	0x0	ro	Receiver overflow error This bit is set by hardware when the data is received while

				the RDBF is still set. It is cleared by software. (Read USART_STS register followed by a USART_DT read operation) 0: No overflow error 1: Overflow error is detected. Note: When this bit iset, the DT regiter content will not be lost, but the subsequent data will be overwritten.
Bit 2	NERR	0x0	ro	Noise error This bit is set by hardware when noise is detect on a received frame. It is cleared by software. (Read USART_STS register followed by a USART_DT read operation) 0: No noise is detected. 1: Noise is detected.
Bit 1	FERR	0x0	ro	Framing error This bit is set by hardware when a stop bit error (low), excessive noise or break frame is detected. It is cleared by software. USART_STS register followed by a USART_DT read operation) 0: No framing error is detected. 1: Framing error is detected.
Bit 0	PERR	0x0	ro	Parity error This bit is set by hardware when parity error occurs. It is cleared by software. USART_STS register followed by a USART_DT read operation) 0: No parity error occurs. 1: Parity error occurs.

12.11.2 Data register (USART_DT)

Bit	Register	Reset value	Type	Description
Bit 31: 9	Reserved	0x000000	resd	Forced to be 0 by hardware.
Bit 8: 0	DT	0x00	rw	Data value his register provides read and write function. When transmitting with the parity bit enabled, the value written in the MSB bit will be replaced by the parity bit. When receiving with the parity bit enabled, the value in the MSB bit is the received parity bit.

12.11.3 Baud rate register (USART_BAUDR)

Note: If the TEN and REN bits are disabled, the baud counter stops counting.

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Forced to be 0 by hardware.
Bit 15: 0	DIV	0x0000	rw	Divider This field define the USART divider.

12.11.4 Control register1 (USART_CTRL1)

Bit	Register	Reset value	Type	Description
Bit 31: 14	Reserved	0x00000	resd	Forced to be 0 by hardware.
Bit 13	UEN	0x0	rw	USART enable 0: USART is disabled. 1: USART is enable.
Bit 12	DBN	0x0	rw	Data bit num This bit is used to program the number of data bits. 0: 8 data bits 1: 9 data bits
Bit 11	WUM	0x0	rw	Wakeup mode

				This bit determines the way to wake up silent mode. 0: Waken up by idle line 1: Waken up by ID match
Bit 10	PEN	0x0	rw	Parity enable This bit is used to enable hardware parity control (generation of parity bit for transmission; detection of parity bit for reception). When this bit is enabled, the MSB bit of the transmitted data is replaced with the parity bit; Check whether the parity bit of the received data is correct. 0: Parity control is disabled. 1: Parity control is enabled.
Bit 9	PSEL	0x0	rw	Parity selection This bit selects the odd or even parity after the parity control is enabled. 0: Even parity 1: Odd parity
Bit 8	PERRIEN	0x0	rw	PERR interrupt enable 0: Interrupt is disabled. 1: Interrupt is enabled.
Bit 7	TDBEIEN	0x0	rw	TDBE interrupt enable 0: Interrupt is disabled. 1: Interrupt is enabled.
Bit 6	TDCIEN	0x0	rw	TDC interrupt enable 0: Interrupt is disabled. 1: Interrupt is enabled.
Bit 5	RDBFIEN	0x0	rw	RDBF interrupt enable 0: Interrupt is disabled. 1: Interrupt is enabled.
Bit 4	IDLEIEN	0x0	rw	IDLE interrupt enable 0: Interrupt is disabled. 1: Interrupt is enabled.
Bit 3	TEN	0x0	rw	Transmitter enable This bit enables the transmitter. 0: Transmitter is disabled. 1: Transmitter is enabled.
Bit 2	REN	0x0	rw	Receiver enable This bit enables the receiver. 0: Receiver is disabled. 1: Receiver is enabled.
Bit 1	RM	0x0	rw	Receiver mute This bit determines if the receiver is in mute mode or not. It is set or cleared by software. When the idle line is used to wake up from mute mode, this bit is cleared by hardware after wake up. When the address match is used to wake up from mute mode, it is cleared by hardware after wake up. When address mismatches, this bit is set by hardware to enter mute mode again. 0: Receiver is in active mode. 1: Receiver is in mute mode.
Bit 0	SBF	0x0	rw	Send break frame This bit is used to send a break frame. It can be set or cleared by software. Generally speaking, it is set by software and cleared by hardware at the end of break frame transmission. 0: No break frame is transmitted.

				1: Break frame is transmitted.

12.11.5 Control register2 (USART_CTRL2)

Bit	Register	Reset value	Type	Description
Bit 31: 15	Reserved	0x00000	resd	Forced to be 0 by hardware.
Bit 14	LINEN	0x0	rw	LIN mode enable 0: LIN mode is disabled. 1: LIN mode is enabled.
Bit 13: 12	STOPBN	0x0	rw	STOP bit num These bits are used to program the numter of stop bits. 00: 1 stop bit 01: 0.5 stop bit 10: 2 stop bits 11: 1.5 stop bits
Bit 11	CLKEN	0x0	rw	Clock enable This bit is used to enable the clock pin for synchronous mode or Smartcard mode. 0: Clock is disabled. 1: Clock is enabled.
Bit 10	CLKPOL	0x0	rw	Clock polarity In synchronous mode or Smartcard mode, this bit is used to select the polarity of the clock output on the clock pin in idle state. 0: Clock output low 1: Clock output high
Bit 9	CLKPHA	0x0	rw	Clock phase This bit is used to select the phase of the clock output on the clock pin in synchronous mode or Smartcard mode. 0: Data capture is done on the first clock edge. 1: Data capture is done on the second clock edge.
Bit 8	LBCP	0x0	rw	Last bit clock pulse This bit is used to select whether the clock pulse of the last data bit transmitted is output on the clock pin in synchronous mode. 0: The clock pulse of the last data bit is no output on the clock pin. 1: The clock pulse of the last data bis is output on the clock pin.
Bit 7	Reserved	0x0	resd	Keep at its default value.
Bit 6	BFIEN	0x0	rw	Break frame interrupt enable 0: Disabled 1: Enabled
Bit 5	BFBN	0x0	rw	Break frame bit num This bit is used to select 11-bit or 10-bit break frame. 0: 10-bit break frame 1: 11-bit break frame
Bit 4	Reserved	0x0	resd	Keep at its default value.
Bit 3: 0	ID	0x0	rw	USART identification Configurable USART ID.

Note: These three bits (CLKPOL, CLKPHA and LBCP) should not be changed while the transmission is enabled.

12.11.6 Control register3 (USART_CTRL3)

Bit	Register	Reset value	Type	Description
Bit 31: 11	Reserved	0x000000	resd	Forced to be 0 by hardware.
Bit 10	CTSCFIEN	0x0	rw	CTSCF interrupt enable 0: Interrupt is disabled. 1: Interrupt is enabled.
Bit 9	CTSEN	0x0	rw	CTS enable 0: CTS is disabled. 1: CTS is enabled.
Bit 8	RTSEN	0x0	rw	RTS enable 0: RTS is disabled. 1: RTS is enabled.
Bit 7	DMATEN	0x0	rw	DMA transmitter enable 0: DMA transmitter is disabled. 1: DMA transmitter is enabled.
Bit 6	DMAREN	0x0	rw	DMA receiver enable 0: DMA receiver is disabled. 1: DMA receiver is enabled.
Bit 5	SCMEN	0x0	rw	Smartcard mode enable 0: Smartcard mode is disabled. 1: Smartcard mode is enabled.
Bit 4	SCNACKEN	0x0	rw	Smartcard NACK enable This bit is used to send NACK when parity error occurs. 0: NACK is disabled when parity error occurs. 1: NACK is enabled when parity error occurs.
Bit 3	SLBEN	0x0	rw	Single-wire bidirectional half-duplex enable 0: Single-wire bidirectional half-duplex is disabled. 1: Single-wire bidirectional half-duplex is enabled.
Bit 2	IRDALP	0x0	rw	IrDA low-power mode This bit is used to configure IrDA low-power mode. 0: IrDA low-power mode is disabled. 1: IrDA low-power mode is enabled.
Bit 1	IRDAEN	0x0	rw	IrDA enable 0: IrDA is disabled. 1: IrDA is enabled.
Bit 0	ERRIEN	0x0	rw	Error interrupt enable An interrupt is generated when a framing error, overflow error or noise error occurs. 0: Error interrupt is disabled. 1: Error interrupt is enabled.

12.11.7 Guard time and divider register (GDIV)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Forced to be 0 by hardware.
Bit 15: 8	SCGT	0x00	rw	Smartcard guard time value This field specifies the guard time value. The transmission complete flag is set after this guard time in smartcard mode.
Bit 7: 0	ISDIV	0x00	rw	IrDA/smartcard division In IrDA mode: 8 bit [7: 0] is valid. It is valid in common mode and must be set to 00000001. In low-power mode, it divides the peripheral clock to serve as the period base of the pulse width; 00000000: Reserved–Do not write. 00000001: Divided by 1 00000010: Divided by 2 …… Smartcard mode: the lower 5 bit [4: 0] is valid. This division is used to divide the peripheral clock to provide clock for the Smartcard. Configured as follows: 00000: Reserved–Do not write. 00001: Divided by 2 00010: Divided by 4 00011: Divided by 6 ……

13 Serial peripheral interface (SPI)

13.1 SPI introduction

The SPI interace supports either the SPI protocol or the I²S protocoal, depending on software configuration. This chapter gives an introduction of the main features and congiruation procedure of SPI used as SPI or I²S.

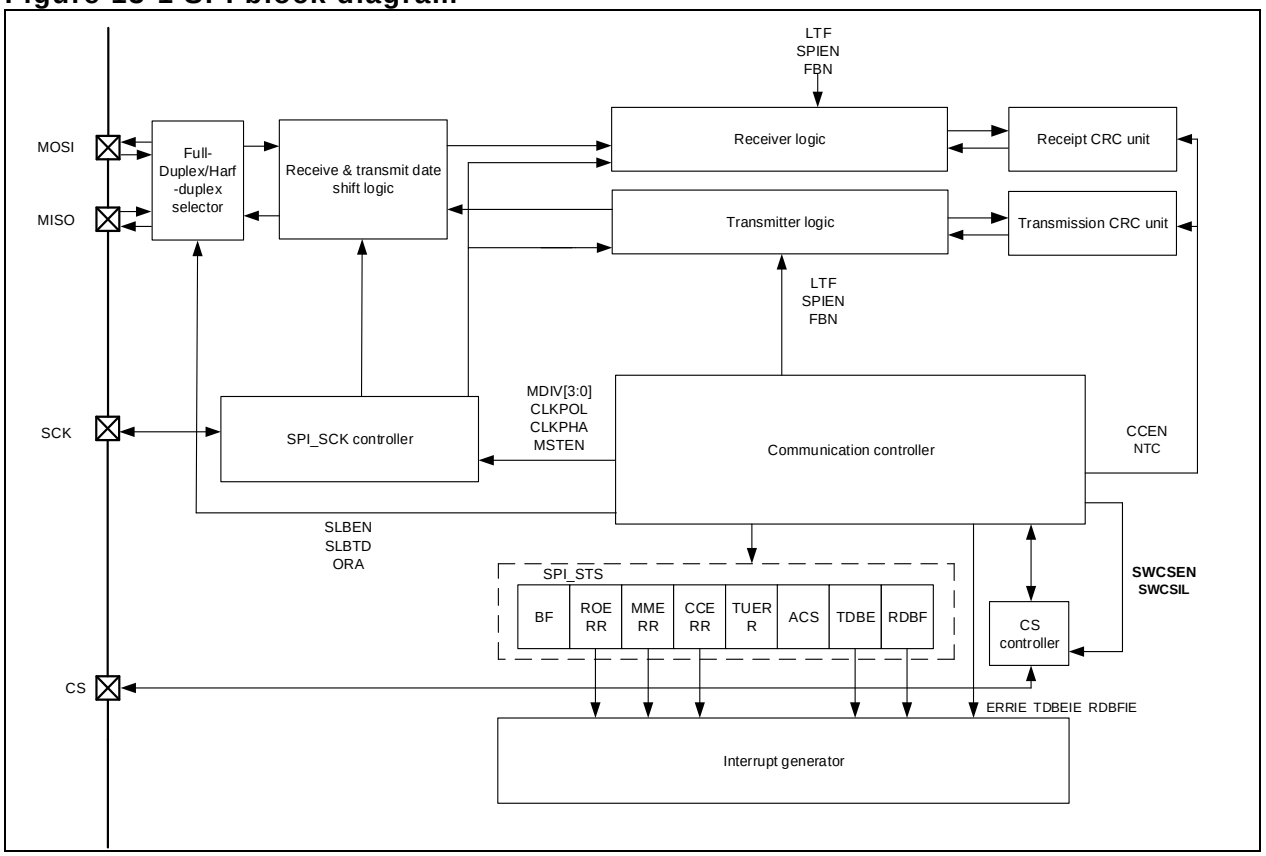
13.2 Function overview

13.2.1 SPI description

The SPI can be configured as host or slave, depending on software configuration, supporting full-duplex, reception-only full-duplex and transmission-only/reception-only half-duplex modes, DMA transfer, and automatic CRC function of SPI internal hardware.

SPI block diagram:

Figure 13-1 SPI block diagram



Main features as SPI:

- Full-duplex or half-duplex communication
  - Full-duplex synchronous communication (select receive-only mode to release IO for transmission)
  - Half-duplex synchronous communication (transfer direction is configurable: receive or transmit)
- Master or slave mode
- CS signal processing mode
  - CS signal processing by hardware
  - CS signal processing by software
- 8-bit or 16-bit frame format
- Communication frequency and frequency division factor (max. frequency division factor up to $f_{PCLK}/2$)

- Programmable clock plarity and phase
- Programmable data transfer order (MSB-first or LSB-first)
- Programmable error interrupt flags (receiver overflow error, master mode error and CRC error)
- Programmable transmit data buffer empty interrupt and receive data buffer full interrupt
- Support transmission and reception using DMA
- Support hardware CRC transmission and error checking
- Busy status flag

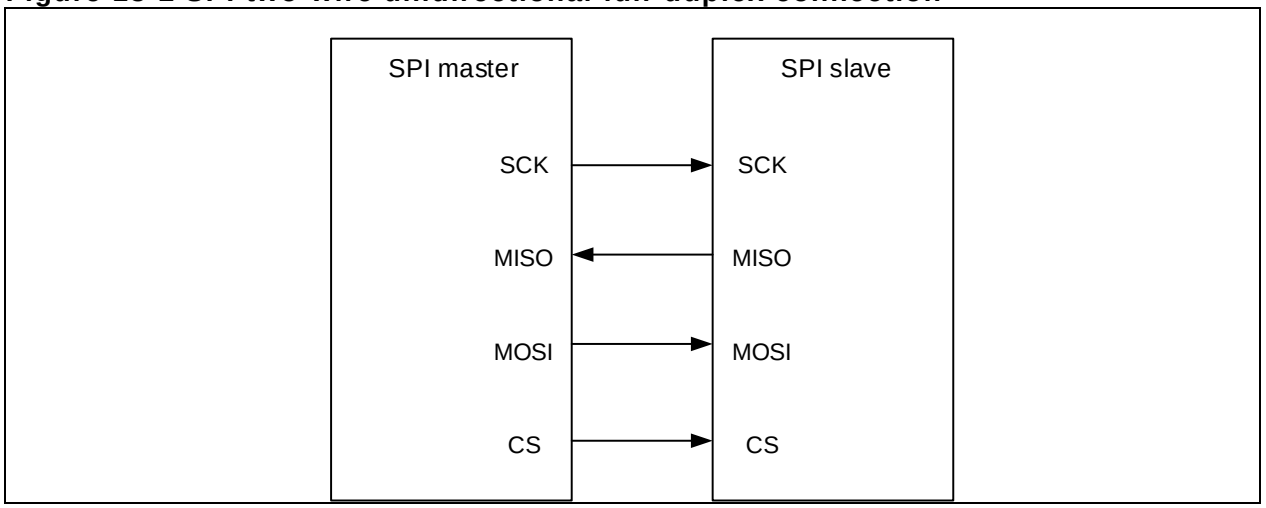
13.2.2 Full-duplex/half-duplex selector

When used as an SPI interface, it supports four synchronous modes: two-wire unidirectional full-duplex, single-wire unidirectional receive only, single-wire bidirectional half-duplex transmit and single-wire bidirectional half-duplex receive.

Figure 13-2 **shows the two-wire unidirectional full-duplex mode and SPI IO connection:**

The SPI operates in two-wire unidirectional full-duplex mode when the SLBEN bit and the ORA bit is both 0. In this case, the SPI supports data transmission and reception at the same time. IO connection is as follows:

Figure 13-2 SPI two-wire unidirectional full-duplex connection



In either master or slave mode, it is required to wait until the RDBF bit and TDBE bit is set, and BF=0 before disabling the SPI or entering power-saving mode (or disabling SPI system clock).

Figure 13-3 **shows the single-wire unidirectional receive-only mode and SPI IO connection**

The SPI operates in single-wire unidirectional receive-only mode when the SLBEN is 0 and the ORA is set. In this case, the SPI can be used only for data reception (transmission is not supported). The MISO pin transmits data in slave mode and receives data in master mode. The MOSI pin transmits data in master mode and receives data in salve mode.

Figure 13-3 Single-wire unidirectional receive only in SPI master mode

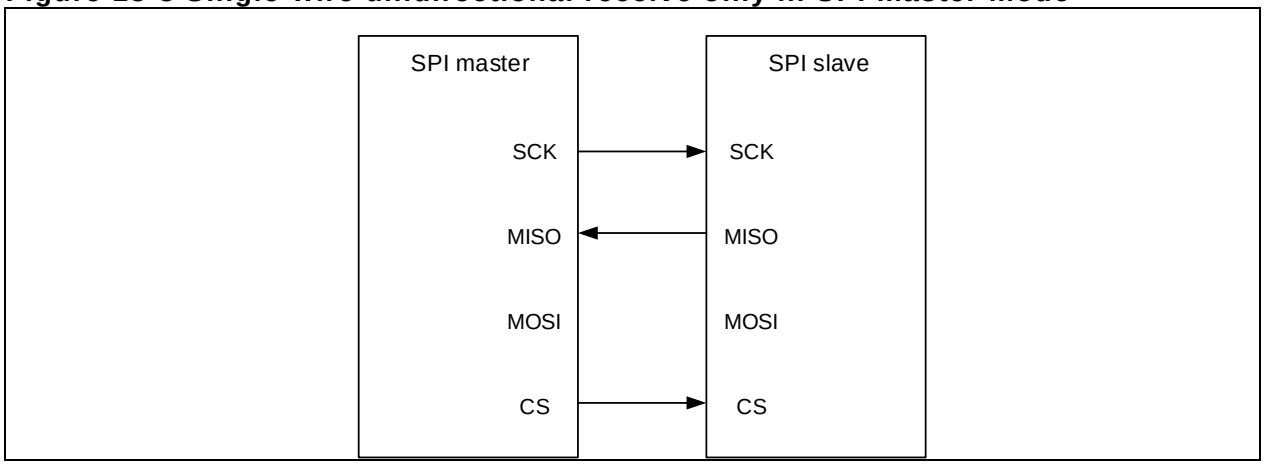


Figure 13-4 Single-wire unidirectional receive only in SPI slave mode

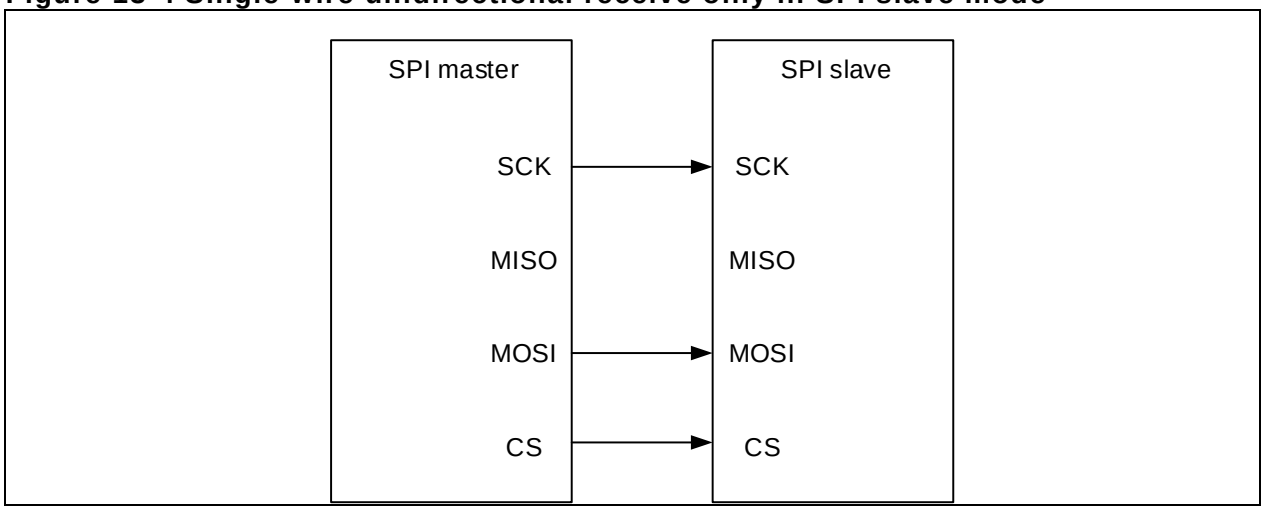


In master mode, it is necessary to wait until the second-to-last RDBF bit is set and then another SPI_CPK period before disabling the SPI. The last RDBF must be set before entering power-saving mode (or disabling SPI system clock).

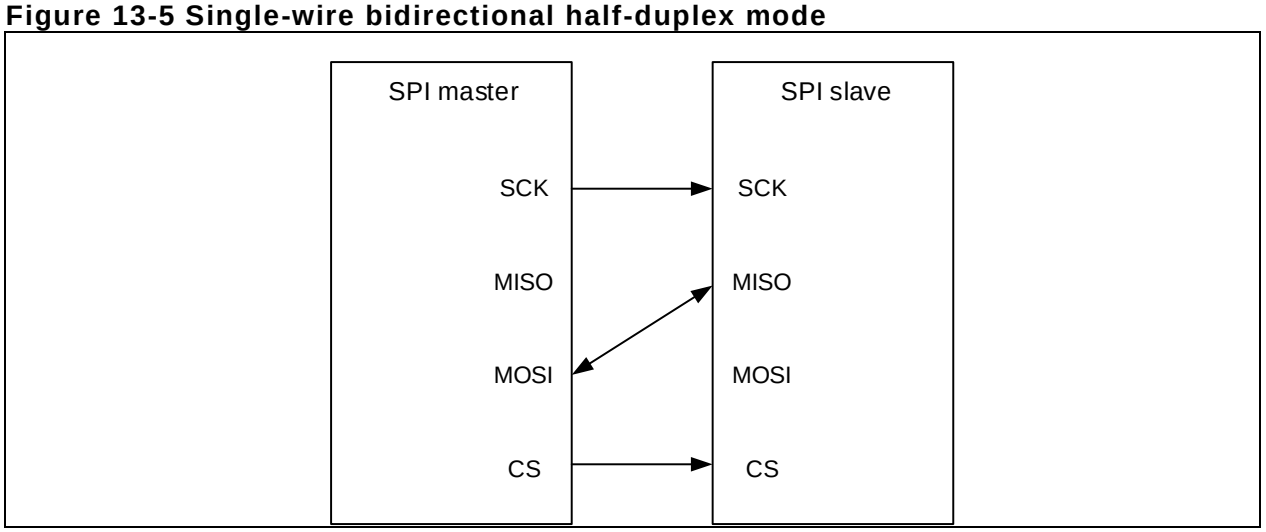
In slave mode, there is no need to check any flag before disabling the SPI. However, it is required to wait until the BF becomes 0 before entering power-saving mode.

Figure 13-5 **shows single-wire bidirectional half-duplex mode and SPI IO connection**

When the SLBEN is set, the SPI operates in single-wire bidirectional half-duplex mode. In this case, the SPI supports data reception and transmission alternately. In master mode, the MOSI pin transmits or receives data in master mode, while the MISO pin is released. In slave mode, the MISO pin transmits or receives data, but the MOSI pin is released.

The SLBTD bit is used by software to configure transfer direction. When the SLBTD bit is set, the SPI can be used only for data transmission; when the SLBTD bit is 0, the SPI can be used only for data reception.

Figure 13-5 Single-wire bidirectional half-duplex mode



When the SPI is selected for data transmission in single-wire bidirectional half-duplex mode (master or slave), the TDBE bit must be set, and the BF must be 0 before disabling the SPI. The power-saving mode (or disabling SPI system clock) cannot be entered unless the SPI is disabled.

In master mode, when the SPI is selected for data reception in single-wire bidirectional half-duplex mode, it is required to wait until the second-to-last RDBF is set and then another SPI_SCK period before disabling the SPI. And the last RDBF must be set before entering power-saving mode (or disabling SPI system clock).

In slave mode, when the SPI is selected for data reception in single-wire bidirectional half-duplex mode, there is no need to check any flags before disabling the SPI. However, the BT must be 0 before entering power-saving mode (or disabling SPI system clock).

13.2.3 Chip select controller

The Chip select controller (CS) is used to enable hardware or software control for chip select signals through software configuration. This controller is used to select master/slave device in multi-processor mode, and to avoid conflicts on the data lines by enabling the SCK signal output followed by CS signal. The hardware and software configuration procedure is detailed as follows, along with their respective input/output in master and slave mode.

CS hardware configuration procedure:

In master mode with CS being as an output, HWCSOE=1, SWCSEN=0, the CS hardware control is enabled. If the SPI is enabled, low level is output on the CS pin. The CS signal is then released after the SPI is disabled and the transmission is complete.

In master mode with CS being as an input, HWCSOE=0, SWCSEN=0, the CS hardware control is enabled. At this point, the SPI is automatically disabled by hardware and enters slave mode as soon as the CS pin low is detected by master SPI. The mode error flag (MMERR bit) is set at the same time. An interrupt is generated if ERRIE=1. When the MMERR is set, the SPIEN and MSTEN cannot be set by software. The MMERR is cleared by read or write access to the SPI_STS register followed by write operation to the SPI_CTRL1 register.

In slave mode with CS being as an input, HWCSOE=0, SWCSEN=0, the CS hardware control is enabled. The slave selects whether to transmit / receive data based on the level on the CS pin. The slave is selected for data reception and transmission only when the CS pin is low.

CS software configuration procedure:

In master mode with CS being as an input, SWCSEN=1, the CS software control is enabled. When SWCSIL=0, the SPI is automatically disabled by hardware and enters slave mode. The mode error flag (MMERR bit) is set at this time. An interrupt is generated if ERRIE=1. When the MMERR bit is set, the SPIEN and MSTEN bits cannot be set by software. The MMERR bit is cleared by read or write access to the SPI_STS register followed by write operation to the SPI_CTRL1 register.

In slave mode with CS being as an input, SWCSEN=1, the CS software control is enabled. The SPI judges the CS signal with the SWCSIL bit, instead of CS pin. When SWCSIL=0, the slave is selected for data reception and transmission.

13.2.4 SPI_SCK controller

The SPI protocol adopts synchronous transmission. In master mode with the SPI being as SPI, it is required to generate a communication clock for data reception and transmission on the SPI, and the communication clock should be output to the slave via IO for data reception and transmission. In slave mode, the communication clock is provided by peripherals, and is input to the SPI via IO. In all, the SPI_SCK controller is used for the generation and distribution of SPI_SCK, with the configuration procedure detailed as follows:

SPI_SCK controller configuration procedure:

- Clock polarity and clock phase selection: It is selected by setting the CLKPOL and CLKPHA bit.
- Clock prescaler selection: Select the desired PCLK frequency by setting the CRM bit. Select the desired prescaler by setting the MDIV[3: 0] bit.
- Master/slave selection: Select SPI as master or slave by setting the MSTEN bit.

Note that the clock output is activated after the SPI is enabled in master reception-only mode, and it remains output until when the SPI is disabled and the reception is complete.

13.2.5 CRC introduction

There is an independent transmission and reception CRC calculation unit in the SPI. When used as SPI through software configuration, the SPI enables CRC calculation and CRC check automatically while the user is reading or writing through DMA or CPU. During the transmission, if the received data is not consistent with, detected by hardware, the data in the SPI_RCRC register, and such data is exactly the CRC value, then the CCERR bit will be set. An interrupt is generated if ERRIE=1.

The CRC function and configuration procedure of the SPI are described as follows.

CRC configuration procedure

- CRC calculation polynominal is configured by setting the SPI_CPOLY register.
- CRC enable: The CRC calculation is enabled by setting the CCEN bit. This operation will reset the SPI_RCRC and SPI_TCRC registers.
- Select if or when the NTC bit is set, depending on DMA or CPU data register. See the following descriptions.

Trasmission using DMA

When DMA is used to write the data to be transmitted, if the CCEN bit is enabled, the hardware calculates the CRC value automatically according to the value in the SPI_CPOLY register and each transmitted data, and sends the CRC value at the end of the last data transmission. This result is regarded as the value of the SPI_TCRC register.

Reception using DMA

When DMA is used to read the data to be received, if the CCEN bit is enabled, the hardware calculates the CRC value automatically according to the value in the SPI_CPOLY register and each received data, and waits until the completion of CRC data reception at the end of the last data reception before comparing the received CRC value with the value of the SPI_RCRC register. If check error occurs, the CCERR flag is set. An interrupt is generated if the ERRIE bit is enabled.

Transmission using CPU

Unlike DMA mode, after writing the last data to be transmitted, the CPU mode requires the NTC bit to be set by software before the end of the last data transmission.

Reception using CPU

In two-wire unidirectional full-duplex mode, follow CPU transmission mode to operate the NTC bit, the CRC calculation and check in CPU reception mode will be completed automatically.

In single-wire unidirectional reception-only mode and single-wire bidirectional reception-only mode, it is required to set the NTC bit before the software receives the last data when the second-to-last data is received.

13.2.6 DMA transfer

The SPI supports write and read operations with DMA. Refer to the following configuration procedure.

Special attention should be paid to: when the CRC calculation and check is enabled, the number of data transferred by DMA is configured as the number of the data to be transferred. The number of data read with DMA is configured as the number of the data to be received. In this case, the hardware will send CRC automatically at the end of full transfer, and the receiver will also perform CRC check. Note that the received CRC data will be moved into the SPI_DT register by hardware, with the RDBF being set, and the DMA read request will be sent if then DAM transfer is enabled. Hence, it is recommended to read the SPI_DT register to get the CRC value at the end of CRC reception in order to avoid the upcoming transfer error.

Transmission with DMA

- Select DMA channel: Select a DMA channel for the current SPI from DMA channel map table described in DMA chapter.
- Configure the destination of DMA transfer: Configure the SPI_DT register address as the destination address bit of DMA transfer in the DMA control register. Datat will be sent to this address after transmit request is received by DMA.
- Configure the source of DMA transfer: Configure the memory address as the source of DMA transfer in the DMA control register. Data will be loaded into the SPI_DT register from the memory address after transmit request is received by DMA.
- Configure the total number of bytes to be transferred in the DMA control register.
- Configure the channel priority of DMA transfer in the DMA control register.
- Configure DMA interrupt generation after half or full transfer in the DMA control register.
- Enable DMA transfer channel in the DMA control register.

Reception with DMA

- Select DMA transfer channel: Select a DMA channel for the current SPI from DMA channel map table described in DMA chapter.

- Configure the destination of DMA transfer: Configure the memory address as the destination of DMA transfer in the DMA control register. Data will be loaded from the SPI_DT register to the programmed destination after reception request is received by DMA.
- Configure the source of DMA transfer: Configure the SPI_DT register address as the source of DMA transfer in the DMA control register. Data will be loaded from the SPI_DT register to the programmed destination after reception request is received by DMA.
- Configure the total number of bytes to be transferred in the DMA control register.
- Configure the total number of bytes to be transferred in the DMA control register.
- Configure DMA interrupt generation after half or full transfer in the DMA control registe
- Enable DMA transfer channel in the DMA control register.

13.2.7 Transmitter

The SPI transmitter is clocked by SPI_SCK controller. It can output different data frame formats, depending on software configuration. There is a SPI_DT register available in the SPI that is used to be written with the data to be transmitted. When the transmitter is clocked, the contents in the SPI_DT register are copied into the data buffer (Unlike SPI_DT, it is driven by SPI_SCK, and controlled by hardware,instead of software), and sent out in order based on the programmed frame format.

Both DMA and CPU can be used for write operation. For DMA transfer, refer to DMA transfer section for more details. For CPU transfer, attention should be paid to the TDBE bit. The reset value of this bit is 1, indicating that the SPI_DT register is empty. If the TDBEIE bit is set, an interrupt is generated. After the data is written, the TDBE is pulled low until the data is moved to the transmit data buffer before the TDBE is set once again. This means that the user can be allowed to write the data to be transmitted only when the TDBE is set.

After the transmitter is configured and the SPI is enabled, the SPI is ready for data transmission. Before going forward, it is necessary for the users to refer to full-duplex / half-duplex chapter to get detailed configuration information, go to the Chip select controller chapter for specific chip select mode, check the SPI_SCK controller chapter for information on communication clock, and refer to CRC and DMA transfer chapter to configure CRC and DMA (if necessary). The recommended configuration procedure are as follows.

Transmitter configuration procedure:

- Configure full-duplex/half-duplex selector
- Configure chip select controller
- Configure SPI_SCK controller
- Configure CRC (if necessary)
- Configure DMA transfer (if necessary)
- If the DMA transfer mode is not used, the software will check whether to enable transmit data interrupt (TDBEIE =1) through the TDBE bit.
- Configure frame format: select MSB/LSB mmode with the LTF bit, and select 8/16-bit data with the FBN bit
- Enable SPI by setting the SPIEN

13.2.8 Receiver

The SPI receiver is clocked by the SPI_SCK controller. It can output different data frame formats through software configuration. There is a receive data buffer register, driven by the SPI_SCK, in the SPI receiver.

At the last CLK of each transfer, the data is moved from the shift register to the receive data buffer register. Then the transmitter sets the receive data complete flag to the SPI logic. When the flag is detected by the SPI logic, the data in the receive data buffer is copied into the SPI_DT register, with the RDBF being set. This means that the data is received, and it is already stored into the SPI_DT. In this case, read access to the SPI_DT register will clear the RDBF bit.

Both DMA and CPU can be used for read operation. For DMA transfer, refer to DMA transfer section for more details. For CPU transfer, attention should be paid to the RDBE bit. The reset value of this bit is 0, indicating that the SPI_DT register is empty. If the data is received and moved into the SPI_DT, the

RDBF is set, meaning that there are some data to be read in the SPI_DT register. An interrupt is generated if the RDBFIE bit is set.

When the next received data is ready to be moved to the SPI_DT register, if the previous received data is still not read (RDBF=1), then the data overflow occurs. The previous receive data is not lost, but the next received data will do. At this point, the ROERR is set. An interrupt is generated if the ERRIE is set. Read SPI_DT register and then the SPI_STS register will clear the ROERR bit. The recommended configuration procedure is as follows.

Receiver configuration procedure:

- Configure full-duplex/half-duplex selector
- Configure chip select controller
- Configure SPI_SCK controller
- Configure CRC (if necessary)
- Configure DMA transfer (if necessary)
- If the DMA transfer mode is not used, the software will check whether to enable receive data interrupt (RDBEIE =1) through the RDBE bit.
- Configure frame format: select MSB/LSB mmode with the LTF bit, and select 8/16-bit data with the FBN bit
- Enable SPI by setting the SPIEN

13.2.9 Motorola mode

This section describes the SPI communication timings, which includes full-duplex and half-duplex master/slave timings.

Full-duplex communication – master mode

Configured as follows:

MSTEN=1: Master enable

SLBEN=0: Full-duplex mode

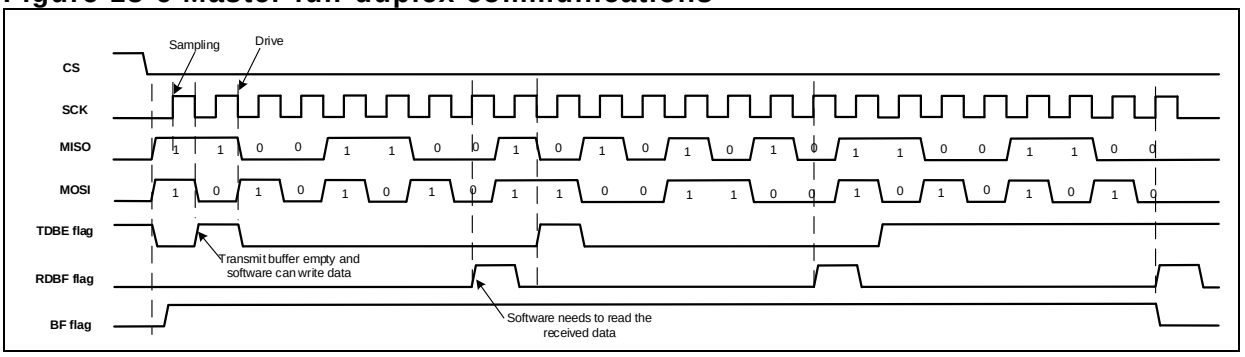
CLKPOL=0, CLKPHA=0: SCK idle output low, use the first edge for sampling

FBN=0: 8-bit frame

Master transmit (MOSI): 0xaa, 0xcc, 0xaa

Slave transmit (MISO): 0xcc, 0xaa, 0xcc

Figure 13-6 Master full-duplex communications



Full-duplex communication – slave mode

Configured as follows:

MSTEN=0: Slave enable

SLBEN=0: Full-duplex mode

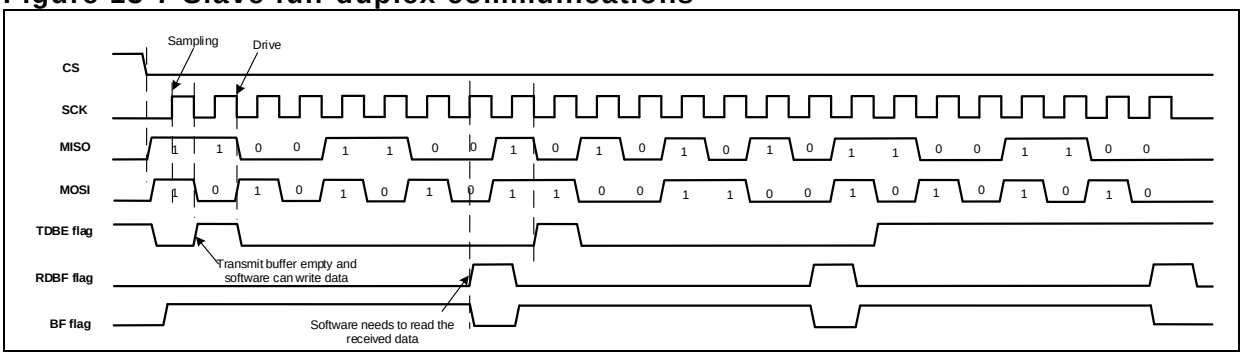
CLKPOL=0, CLKPHA=0: SCK idle output low, use the first edge for sampling

FBN=0: 8-bit frame

Master transmit (MOSI): 0xaa, 0xcc, 0xaa

Slave transmit (MISO): 0xcc, 0xaa, 0xcc

Figure 13-7 Slave full-duplex communications



Half-duplex communication – master transmit

Configured as follows:

MSTEN=1: Master enable

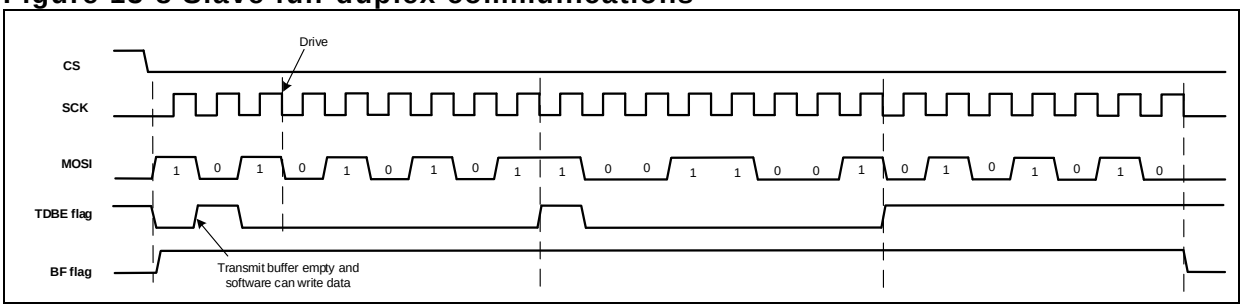
SLBEN=1: Single line bidirectional mode

CLKPOL=0, CLKPHA=0: SCK idle output low, use the first edge for sampling

FBN=0: 8-bit frame

Master transmit (MOSI): 0xaa, 0xcc, 0xaa

Figure 13-8 Slave full-duplex communications



Half-duplex communication – slave receive

Configured as follows:

MSTEN=0: Slave enable

SLBEN=1: Single line bidirectional mode

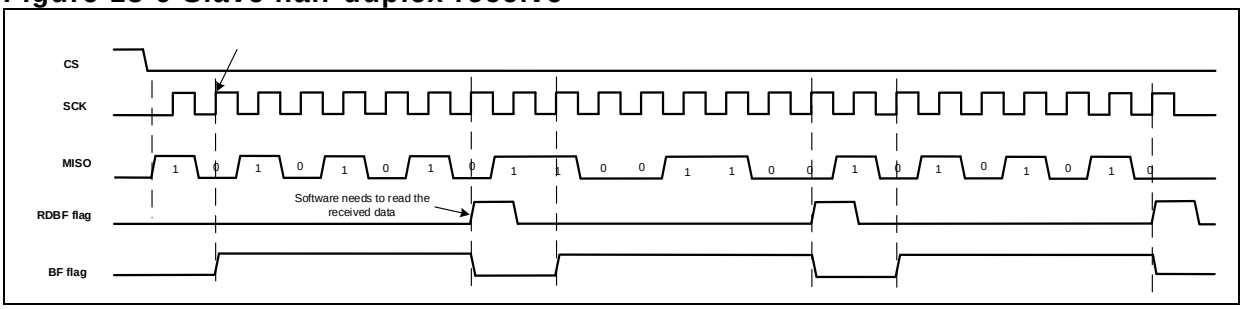
SLBTD=0: Receive mode

CLKPOL=0, CLKPHA=0: SCK idle output low, use the first edge for sampling

FBN=0: 8-bit frame

Slave receive: 0xaa, 0xcc, 0xaa

Figure 13-9 Slave half-duplex receive



Half-duplex communication – slave transmit

Configured as follows:

MSTEN=0: Slave enable

SLBEN=1: Single line bidirectional mode

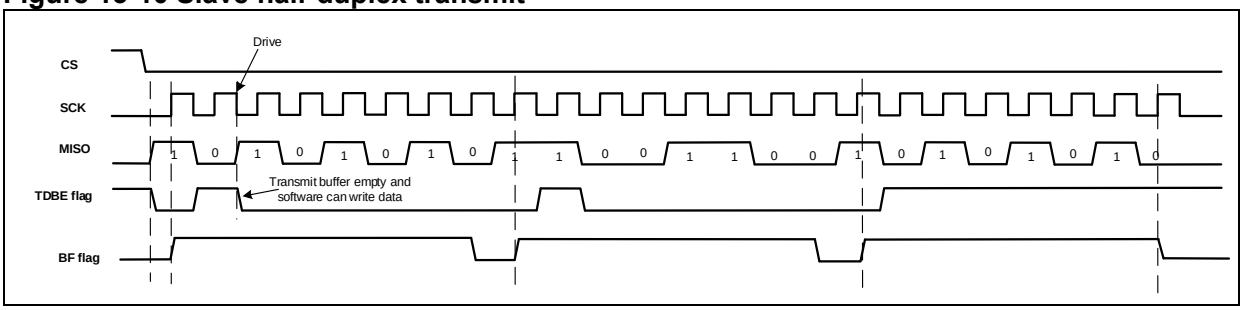
SLBTD=1: Transmit enable

CLKPOL=0, CLKPHA=0: SCK idle output low, use the first edge for sampling

FBN=0: 8-bit frame

Slave transmit: 0xaa, 0xcc, 0xaa

Figure 13-10 Slave half-duplex transmit



Half-duplex communication – master receive

Configured as follows:

MSTEN=1: Master enable

SLBEN=1: Single line bidirectional mode

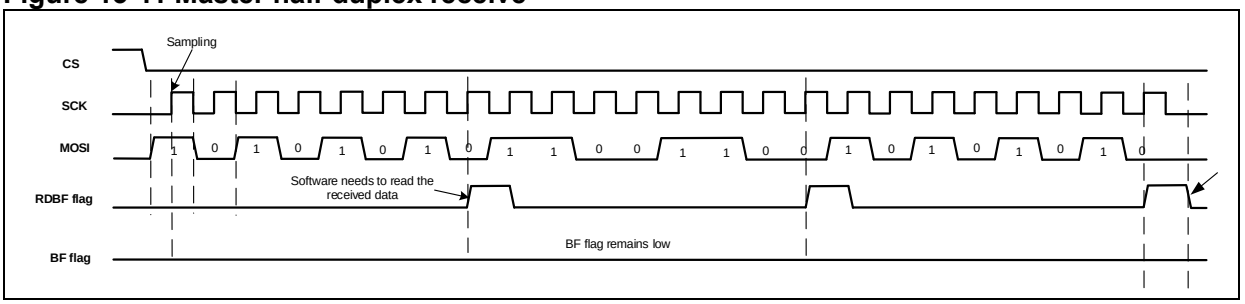
SLBTD=0: Receive enable

CLKPOL=0, CLKPHA=0: SCK idle output low, use the first edge for sampling

FBN=0: 8-bit frame

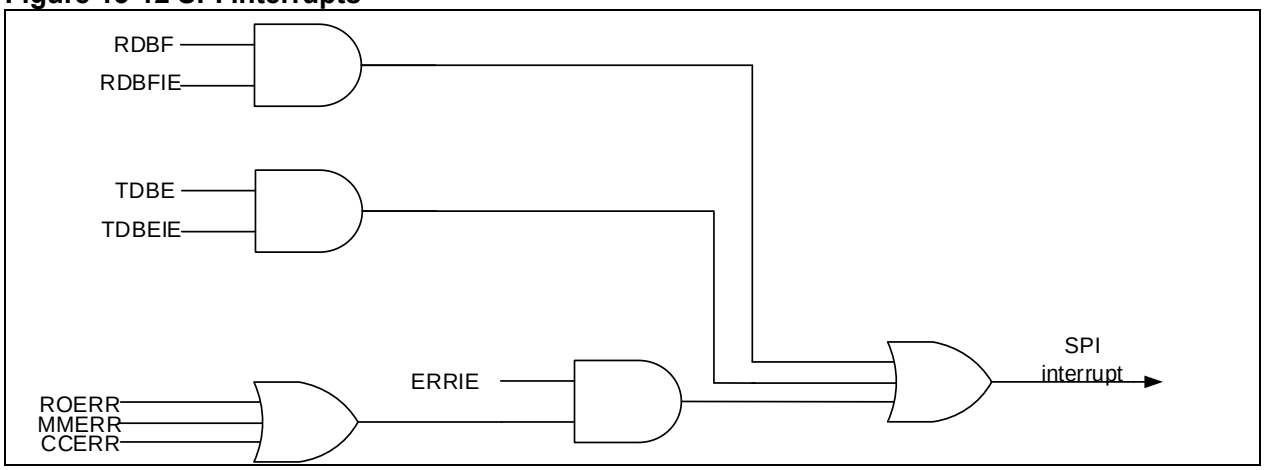
Master receive: 0xaa, 0xcc, 0xaa

Figure 13-11 Master half-duplex receive



13.2.10 Interrrupts

Figure 13-12 SPI interrupts



13.2.11 IO pin control

When used as SPI, the SPI interface is connected to peripherals through up to four pins. Refer to *Section 13.2.2* and *Section 13.2.3* for more information on the usage of pins.

- MISO: Master In/Slave Out. The pin receives data in SPI master mode, and transmits data in SPI slave mode.

- MOSI: Master Out/Slave In. The pin transmits data in SPI master mode, and receives data in SPI slave mode.
- SCK: SPI communication clock pin. In SPI master mode, the pin outputs the communication clock to peripherals. In SPI slave mode, the pin inputs the comumication clock to SPI interface.
- CS: Chip Select. This is an optional pin which selects master/slave device. Refer to *Section 13.2.3* for more information.

13.2.12 Precautions

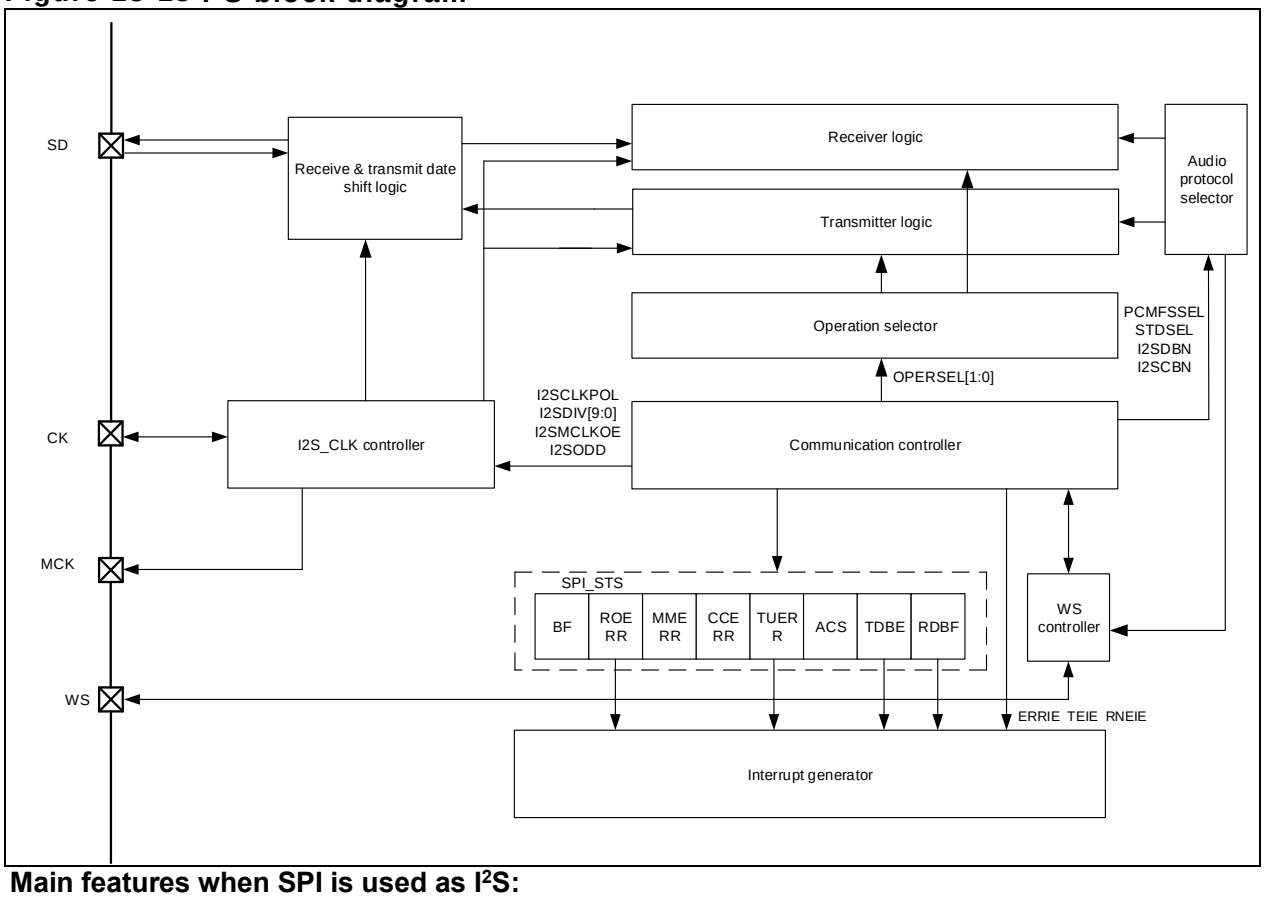
It is necessary to read the DT register in order to get CRC value at the end of CRC reception.

13.3 I²S functional description

13.3.1 I²S introduction

The I2S can be configured by software as master repection/transmission, and slave reception/transmission, supporting four kinds of audio protocols including Philips standard, MSB-aligned standard, LSB-aligned standard and PCM standard, respectively. The DMA transfer is also supported.

Figure 13-13 I²S block diagram



Main features when SPI is used as I²S:

- Programmable operation mode
  - Slave device transmission
  - Slave device reception
  - Master device transmission
  - Master device reception
- Programmable clock polarity
- Programmable clock frequency (8 KHz to 192 KHz)
- Prorammable data bits (16 bit, 24 bit, 32 bit)
- Programmable channel bits (16 bit, 24 bit)

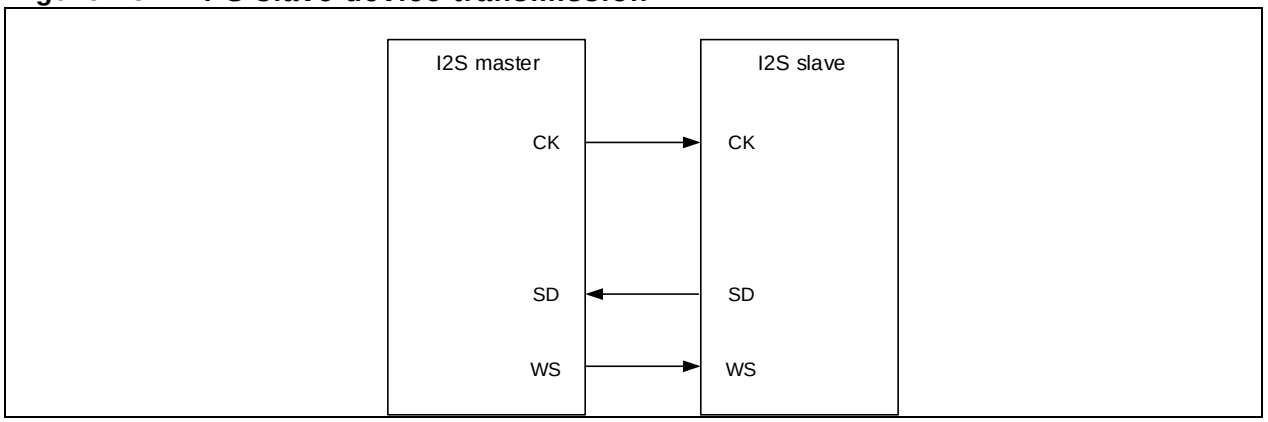
- Programmable audio protocol
  - I²S Philips standard
  - MSB-aligned standard (left-aligned)
  - LSB-aligned standard (right-aligned)
  - PCM standard (long or short frame)
- DMA transfer
- Main peripheral clock with a fixed frequence of 256 x Fs (audio sampling frequency)

13.3.2 Operation mode selector

When used as I²S selector, the SPI interface offers multiple operation modes for selection, namely, slave device transmission, slave device reception, master device transmission and master device reception. This is done by software configuration.

Slave device transmission:
Set the I2SMSEL bit, and OPERSEL[1:0] =00, the I²S will work in slave device transmission mode.

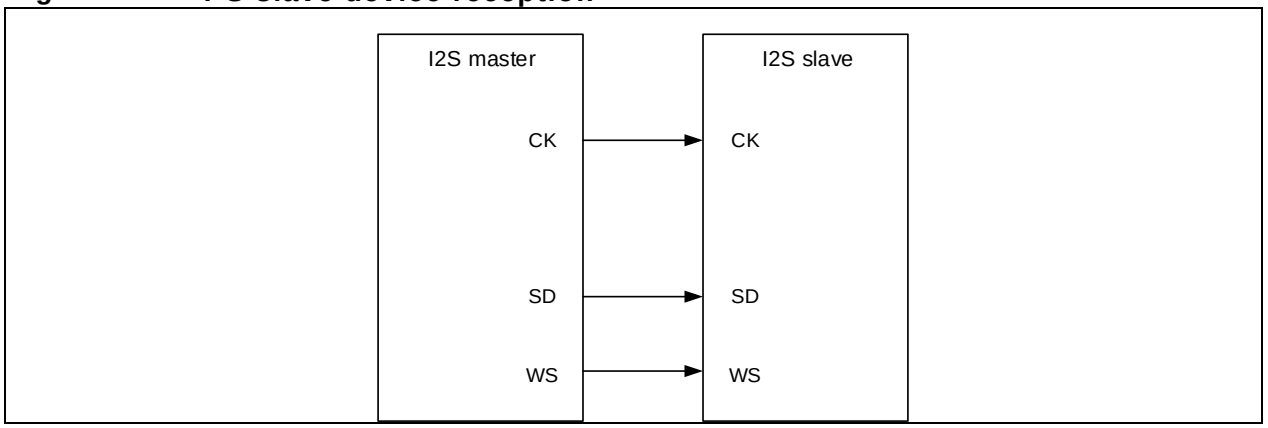
Figure 13-14 I²S slave device transmission



Slave device reception:

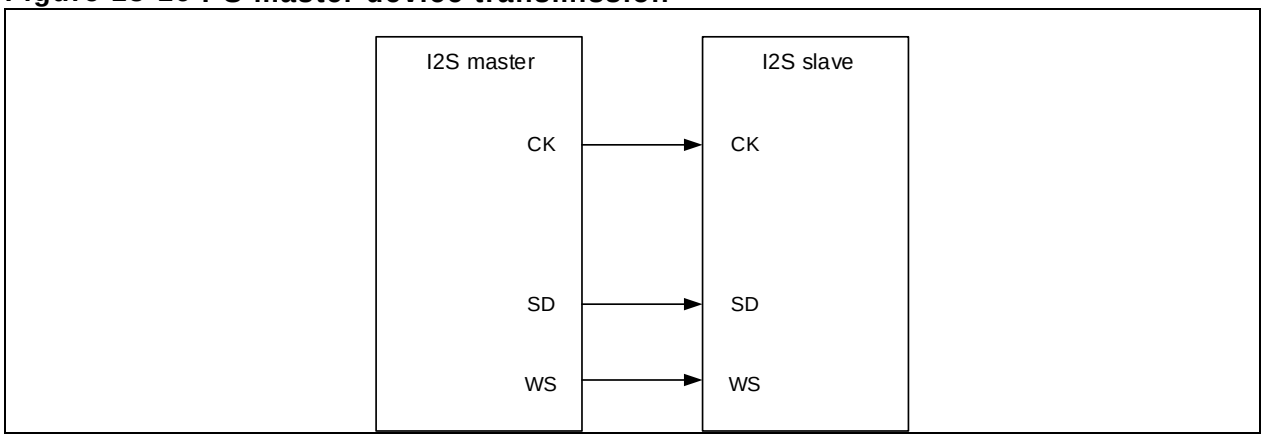
Set the I2SMSEL bit, and OPERSEL[1:0]=01, the I²S will work in slave device reception mode.

Figure 13-15 I²S slave device reception



Master device transmission:
Set the I2SMSEL bit, and OPERSEL[1:0]=10, the I²S will work in master device transmission mode.

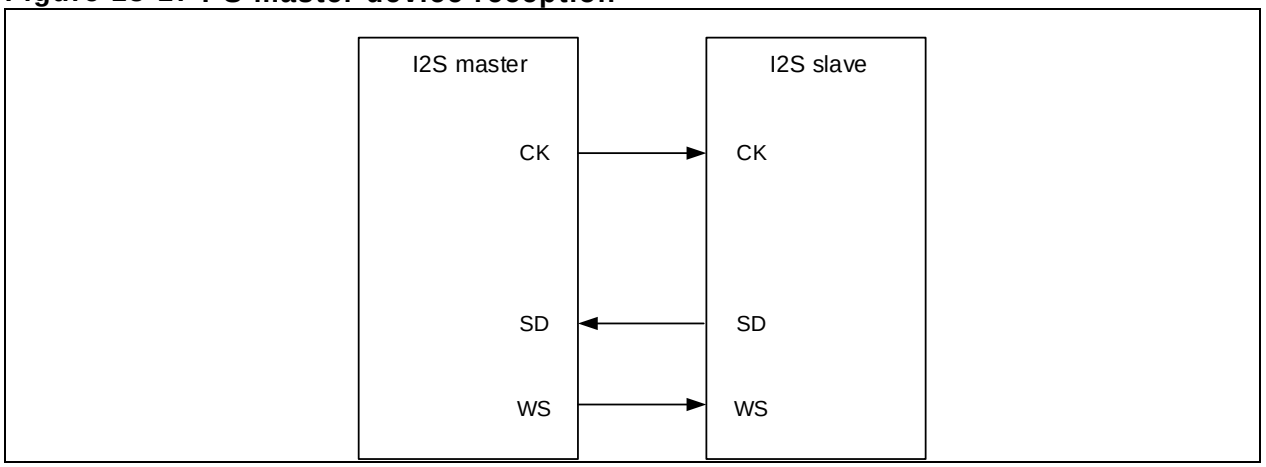
Figure 13-16 I²S master device transmission



Master device reception:

Set the I2SMSEL bit, and OPERSEL[1: 0]=11, the I²S will work in master device repection mode.

Figure 13-17 I²S master device reception



13.3.3 Audio protocol selector

While used as I²S, the SPI supports multiple audio protocols. The user can control the audio protol selector through software configuration to select the desired audio protocol, with the number of data bits and channel bits controlled by the audio protocol selector. Besides, the user can also select the number of data bits and channel bits by software. Meanwhile, the audio protocol selector manages the WS controller, output or detect the WS siganal that meets the protocol requirements.

- Select audio protocol by seeting the STDSEL bit
  STDSLE=00: Philips standard
  STDSLE=01: MSB-aligned standard (left-aligned)
  STDSLE=10: LSB-aligned standard (right-aligned)
  STDSLE=11: PCM standard
- Select PCM frame synchronization format: PCMFSSEL=1 for PCM long frame synchronization, PCMFSSEL=0 for short frame synchronization (this step is required when selecting PCM protocol)
- Select data bits by setting the I2SDBN bit
  I2SDBN=00: 16 bit
  I2SDBN =01: 24 bit
  I2SDBN =10: 32 bit
- Select channel bits by setting the I2SCBN bit
  I2SDBN =0: 16 bit
  I2SDBN =1: 32 bit

Note: Read/Write operation mode depends on the selected audio protocols, data bits and channel bits. The following lists all possible configuration combinations and their respective read and write operation mode.

- Philips, PCM, MSB-aligned or LSB-aligned standard, 16-bit data and 16-bit channel

  The number of data bits is the same as the channel bit. Each channel requires one read/write operation from/ to the SPI_DT register, and the number of DMA transfer is 1.
- Philips, PCM or MSB-aligned standard, 16-bit data and 32-bit channel

  The data bit is different from the channel bit. Each channel requires one read/write operation from/to the SPI_DT register, and the number of DMA transfer is 1. The first 16 bits are valid, and the last 16-bit is forced to 0 by hardware.
- Philips, PCM or MSB-aligned standard, 24-bit data and 32-bit channel

  The number of data bits are different from that of the channgle bit. Each channel requires two read/write operations from/to the SPI_DT register, and the number of DMA transfer is 2. The first 16-bit channel transmits and receives the first 16-bit data, while the last 16-bit channel transmits and receives the 8-bit MSB data, with 8-bit LSB data forced to 0 by hardware.
- Philips standard, PCM standard, MSB-aligned or LSB-aligned standard, 32-bit data and 32-bit channel

  The number of data bits are the same as the channel bit. Each channel requires two read/write operations from/to the SPI_DT register, and the number of DMA transfer is 2. These 32-bit data are proceeded in two times, with 16-bit data each time.
- LSB-aligned standard, 16-bit data and 32-bit channel

  The number of data bits is different from that of the channel bit. Each channel requires one read/write operation from/to the SPI_DT register, and the number of DMA transfer is 1. Only the last 16 bits are valid, while the first 16-bit data are forced to 0 by hardware.
- LSB-aligned standard, 24-bit data and 32-bit channel

  The number of data bits is different from that of the channel bit. Each channel requires two read/write operations from/to the SPI_DT register, and the number of DMA transfer is 2.

  For the first 16-bit channel, only the 8-bit LSB are valid, and the 8-bit MSB are forced to 0 by hardware; The last 16-bit channel transmits and receives the second 16-bit data.

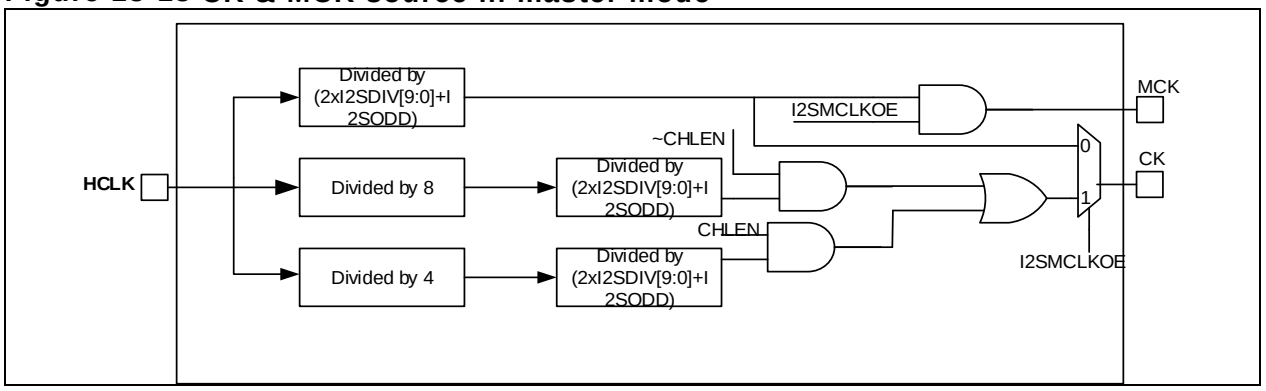
13.3.4 I2S_CLK controller

When used as I^2S interface, all the audio protocols supported by this interface are synchronous protocols. In master mode, it is necessary to generate a communication clock for data reception and transmission on the SPI, and the communication clock should be output to the slave via IO for data reception and transmission. In slave mode, the communication clock is provided by master, and is input to the SPI via IO. In all, the I2S_SCK controller is used for the generation and distribution of I2S_SCK, with the configuration procedure detailed as follows:

When used as I2S master, the SPI can provide communication clock (CK) and main peripheral clock (MCK) shown in Figure 13-12. The CK and MCK are generated by HCLK divider, with the prescaler of the MCK depending on I2SDIV and I2SODD. The calculation formula is seen in Figure 13-12.

The frequency division factor of the CK depends on whether to provide the main clock for peripherals. To ensure that the main clock is always 256 times the audio sampling frequency, Besides, the numer of channel bits should also be taken into account. When the main clock is needed for peripherals, the CK should be divided by 8 (I2SCBN=0) or 4 (I2SCBN=1), and then divided by the same frequency divions factor as that of the MCK before getting the final communication clock; When the main clock is not needed for peripherals, the the frequency division factor of the CK is determined by I2SDIV and I2SODD, shown in *Figure 13-12*.

Figure 13-18 CK & MCK source in master mode



Apart from the above-mentioned configuration, the following table lists the values of I2SDIV and I2SODD corresponding to some specific frequencies, as well as their respective tolerance. The users can configure the I2SDIV and I2SODD based on the list.

Table 13-1 Audio frequency precision using system clock

13.3.5 DMA transfer

The SPI interface supports data write and read using DMA. Whether as SPI or I²S, read/write request using DMA comes from the same peripheral. As a result, their configuration procedure are the same, described as follows.

Transmission with DMA

- Select a DMA channel: Select a DMA channel for the current SPI from DMA channel map table described in DMA chapter.
- Configure the destination of DMA transfer: Configure the SPI_DT register address as the destination address bit of DMA transfer in the DMA control register. Datat will be sent to this address after transmit request is received by DMA.
- Configure the source of DMA transfer: Configure the memory address as the source of DMA transfer in the DMA control register. Data will be loaded into the SPI_DT register from the memory address after transmit request is received by DMA.
- Configure the total number of bytes to be transferred in the DMA control register.
- Configure the channel priority of DMA transfer in the DMA control register.
- Configure DMA interrupt generation after half or full transfer in the DMA control register.
- Enable DMA transfer channel in the DMA control register.

Reception with DMA

- Select a DMA transfer channel: Select a DMA channel for the current SPI from DMA channel map table described in DMA chapter.
- Configure the destination of DMA transfer: Configure the memory address as the destination of DMA transfer in the DMA control register. Data will be loaded from the SPI_DT register to the programmed destination after reception request is received by DMA.
- Configure the source of DMA transfer: Configure the SPI_DT register address as the source of DMA transfer in the DMA control register. Data will be loaded from the SPI_DT register to the programmed destination after reception request is received by DMA.
- Configure the total number of bytes to be transferred in the DMA control register.
- Configure the total number of bytes to be transferred in the DMA control register.
- Configure DMA interrupt generation after half or full transfer in the DMA control registe
- Enable DMA transfer channel in the DMA control register.

13.3.6 Transmitter/Receiver

Whether used as SPI or I2S, there is no difference for CPU. The SPI (in whatever mode) shares the same base address, the same SPI_DT register, the same transmitter and receiver. The SPI transmitter and receiver is responsible for sending and receiving the desired data frame according to the configuration of the communication controller. Thus their status flags such as TDBE, RDBF and ROERR, and their interrupt enable bits including TDBEIE, RDBFIE and ERRIE are identifical.

Special attention must be paid to:

- CRC check is not supported on the I²S. Any operation relative to CRC, including CCERR flag and the corresponding interrupts, is not supported.
- I²S protocol needs decode the current channel status. The ACS bit is used to judge whether the current transfer occurs on the left channel (ACS=0) or the right channel (ACS=1).
- TUERR bit indicates whether an underrun occurs. TUERR=1 means an underrun error occurs on the transmitter. An interrupt is generated when the ERRIE is set.
- Read/write operation to the SPI_DT register is different under different audio protocols, data bits and channel bits. Refer to the audio protocol selector section for more information.
- Pay more attention to the I²S disable operation under different configurations, shown as follows:
  - 2SDBN=00, I2SCBN=1, STDSLE=10: wait for the second-to-last RDBF=1 and 17 CK periods before disabling the I²S.

- I2SDBN=00, I2SCBN=1, STDSLE=00 or STDSLE=01 or STDSLE=11: wait for the last RDBF=1 and one CK period before the I²S.
- I2SDBN, I2SCBN,STDSLE combination: wait for the second-to-last RDBF=1 and one CK period before disabling the I²S.

I²S transmitter configuration procedure:

- Configure operation mode selector
- Configure audio protocol selector
- Configure I2S_SCK controller
- Configure DMA transfer (if necessary)
- Set the I2SEN bit to enable I²S
- Follow above steps to configure the I²SxEXT (For I²S full-duplex mode)

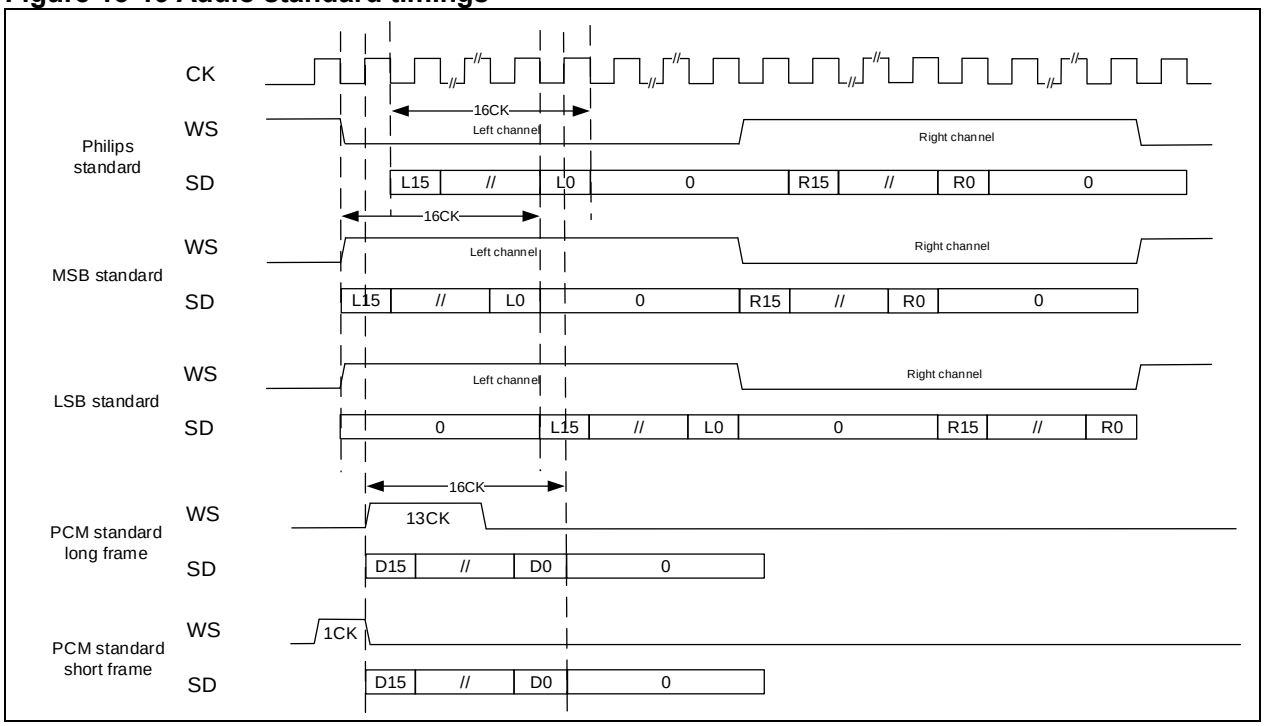
I²S receiver configuration procedure:

- Configure operation mode selector
- Configure audio protocol selector
- Configure I2S_SCK controller
- Configure DMA transfer (if necessary)
- Set the I2SEN bit to enable I²S
- Follow above steps to configure the I²SxEXT (For I²S full-duplex mode)

13.3.7 I2S communication timings

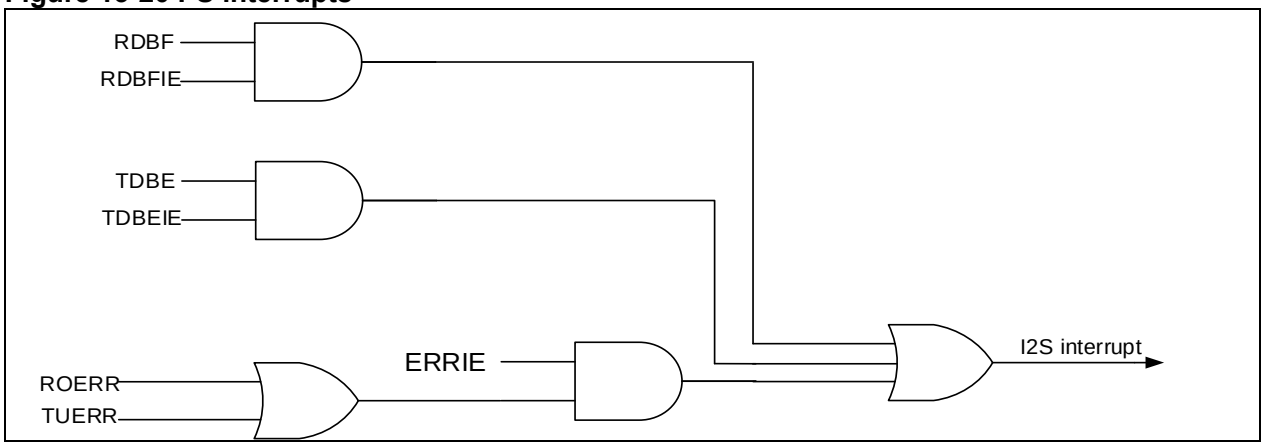
I2S can address four different audio standards: Philips standard, the most significant byte (left-aligned) and the least significant byte (right-aligned) standards, and the PCM standard. *Figure 13-19* shows their respective timgins.

Figure 13-19 Audio standard timings



13.3.8 Interrupts

Figure 13-20 I²S interrupts



13.3.9 IO pin control

When used as I²S, the I²S needs three pins for transfer operation, namely, the SD (data pin), WS (synchronization pin) and CK (communication clock pin). The MCLK pin is also required if need to provide main clock for peripherals. The SPI interface cannot be used as both I²S and SPI simultaneously, so the I²S shares some pins with the SPI, described as follows:

- SD: Serial data (mapped on the MOSI pin) for bidirectional data transmission and reception.
- WS: Word select (mapped on the CS pin) for data control signal output in master mode, and input in slave mode.
- CK: Communication clock (mapped on the SCK pin) as clock signal output in master mode,and input in slave mode.
- MCLK: Master clock (mapped independently) is used to provide main clock for peripherals. The frequency of output clock signal is set to 256 x Fs (audio sampling frequency)

13.4 SPI registers

These peripheral registers must be accessed by word (32 bits).

Table 13-2 SPI register map and reset value

Register	Offset	Reset value
SPI_CTRL1	0x00	0x0000
SPI_CTRL2	0x04	0x0000
SPI_STS	0x08	0x0002
SPI_DT	0x0C	0x0000
SPI_CPOLY	0x10	0x0007
SPI_RCRC	0x14	0x0000
SPI_TCRC	0x18	0x0000
SPI_I2SCTRL	0x1C	0x0000
SPI_I2SCLKP	0x20	0x0002

13.4.1 SPI control register1 (SPI_CTRL1) (Not used in I²S mode)

Bit	Register	Reset value	Type	Description
Bit 15	SLBEN	0x0	rw	Single line bidirectional half-duplex enable 0: Disabled 1: Enabled
Bit 14	SLBTD	0x0	rw	Single line bidirectional half-duplex transmission direction This bit and the SLBEN bit together determine the data output direction in “Single line bidirectional half-duplex” mode. 0: Receive-only mode 1: Transmit-only mode
Bit 13	CCEN	0x0	rw	RC calculation enable 0: Disabled 1: Enabled
Bit 12	NTC	0x0	rw	Transmit CRC next When this bit is set, it indicates that the next data transferred is CRC value. 0: Next transmitted data is the normal value 1: Next transmitted data is CRC value
Bit 11	FBN	0x0	rw	Frame bit num This bit is used to configure the number of data frame bit for transmission/reception. 0: 8-bit data frame 1: 16-bit data frame
Bit 10	ORA	0x0	rw	Receive-only active In two-wire unidirectional mode, when this bit is set, it indicates that Receive-only is active, but the transmit is not allowed. 0: Transmission and reception 1: Receive-only mode
Bit 9	SWCSEN	0x0	rw	Software CS enable When this bit is set, the CS pin level is determined by the SWCSIL bit. The status of I/O level on the CK pin is invalid. 0: Disabled 1: Enabled
Bit 8	SWCSIL	0x0	rw	Software CS internal level

				This bit is valid only when the SWCSEN is set. It determines the level on the CS pin. In master mode, this bit must be set. 0: Low level 1: High level
Bit 7	LTF	0x0	rw	LSB transmit first This bit is used to select for MST transfer first or LSB transfer first. 0: MSB 1: LSB
Bit 6	SPIEN	0x0	rw	SPI enable 0: Disabled 1: Enabled
Bit 5: 3	MDIV	0x0	rw	Master clock frequency division In master mode, the peripheral clock divided by the prescaler is used as SPI clock. The MDIV[3] bit is in the SPI_CTRL2 register, MDIV[3: 0]: 0000: Divided by 2 0001: Divided by 4 0010: Divided by 8 0011: Divided by 16 0100: Divided by 32 0101: Divided by 64 0110: Divided by 128 0111: Divided by 256 1000: Divided by 512 1001: Divided by 1024
Bit 2	MSTEN	0x0	rw	Master enable 0: Disabled (Slave) 1: Enabled (Master)
Bit 1	CLKPOL	0x0	rw	Clock polarity Indicates the polarity of clock output in idle state. 0: Low level 1: High level
Bit 0	CLKPHA	0x0	rw	Clock phase 0: Data capture starts from the first clock edge 1: Data capture starts from the second clock edge

Note: The SPI_CTRL1 register must be 0 in I^2S mode.

13.4.2 SPI control register2 (SPI_CTRL2)

Bit	Register	Reset value	Type	Description
Bit 15: 9	Reserved	0x00	resd	Forced to be 0 by hardware.
Bit 8	MDIV	0x0	rw	Master clock frequency division Refer to the MDIV[2: 0] of the SPI_CTRL1 register.
Bit 7	TDBEIE	0x0	rw	Transmit data buffer empty interrupt enable 0: Disabled 1: Enabled
Bit 6	RDBFIE	0x0	rw	Receive data buffer full interrupt enable 0: Disabled 1: Enabled
Bit 5	ERRIE	0x0	rw	Error interrupt enable This bit controls interrupt generation when errors occur (CCERR, MMERR, ROERR, TUERR and CSPAS) 0: Disabled

				1: Enabled
Bit 4: 3	Reserved	0x0	resd	Kept at its default value
Bit 2	HWCSOE	0x0	rw	Hardware CS output enable This bit is valid only in master mode. When this bit is set, the I/O output on the CS pin is low; when this bit is 0, the I/O input on the CS pin must be set high. 0: Disabled 1: Enabled
Bit 1	DMATEN	0x0	rw	DMA transmit enable 0: Disabled 1: Enabled。
Bit 0	DMAREN	0x0	rw	DMA receive enable 0: Disabled 1: Enabled

13.4.3 SPI status register (SPI_STS)

Bit	Register	Reset value	Type	Description
Bit 15: 8	Reserved	0x00	resd	Forced to be 0 by hardware
Bit 7	BF	0x0	ro	Busy flag 0: SPI is not busy. 1: SPI is busy.
Bit 6	ROERR	0x0	ro	Receiver overflow error 0: No overflow error 1: Overflow error occurs.
Bit 5	MMERR	0x0	ro	Master mode error This bit is set by hardware and cleared by software (read/write access to the SPI_STS register, followed by write operation to the SPI_CTRL1 regitser) 0: No mode error 1: Mode error occurs.
Bit 4	CCERR	0x0	rw0c	CRC error Set by hardware, and cleared by software. 0: No CRC error 1: CRC error occurs.
Bit 3	TUERR	0x0	ro	Transmitter underload error Set by hardware, and cleared by software (read the SPI_STS register). 0: No underload error 1: Underload error occurs. Note: This bit is only used in I^2S mode.
Bit 2	ACS	0x0	ro	Audio channel state This bit indicates the status of the current audio channel. 0: Left channel 1: Right channel Note: This bit is only used in I^2S mode.
Bit 1	TDBE	0x1	ro	Transmit data buffer empty 0: Transmit data buffer is not empty. 1: Transmit data buffer is not empty.
Bit 0	RDBF	0x0	ro	Receive data buffer full 0: Transmit data buffer is not full. 1: Transmit data buffer is full.

13.4.4 SPI data register (SPI_DT)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DT	0x0000	rw	Data value This register controls read and write operations. When the data bit is set as 8 bit, only the 8-bit LSB [7: 0] is valid.

13.4.5 SPICRC register (SPI_CPOLY) (Not used in I²S mode)

Bit	Register	Reset value	Type	Description
Bit 15: 0	CPOLY	0x0007	rw	CRC polynomial This register contains the polynomial used for CRC calculation. Note: This register is valid only in SPI mode.

13.4.6 SPIRxCRC register (SPI_RCRC) (Not used in I2S mode)

Bit	Register	Reset value	Type	Description
Bit 15: 0	RCRC	0x0000	ro	Receive CRC When CRC calculation is enabled, this register contains the CRC value computed based on the received data. This register is reset when the CCEN bit in the SPI_CTRL1 register is cleared. When the data frame format is set to 8-bit data, only the 8-bit LSB ([7: 0]) are calculated based on CRC8 standard; when 16-bit data bit is selected, follow CRC16 standard. Note: This register is only used in SPI mode.

13.4.7 SPITxCRC register (SPI_TCRC)

Bit	Register	Reset value	Type	Description
Bit 15: 0	TCRC	0x0000	ro	Transmit CRC When CRC calculation is enabled, this register contains the CRC value computed based on the transmitted data. This register is reset when the CCEN bit in the SPI_CTRL1 register is cleared. When the data frame format is set to 8-bit data, only the 8-bit LSB ([7: 0]) are calculated based on CRC8 standard; when 16-bit data bit is selected, follow CRC16 standard. Note: This register is only used in SPI mode.

13.4.8 SPI_I2S register (SPI_I2SCTRL)

Bit	Register	Reset value	Type	Description
Bit 15: 12	Reserved	0x0	resd	Forced to be 0 by hardware.
Bit 11	I2SMSEL	0x0	rw	I²S mode select 0: SPI mode 1: I²S mode
Bit 10	I2SEN	0x0	rw	I²S enable 0: Disabled 1: Enabled
Bit 9: 8	OPERSEL	0x0	rw	I²S operation mode select 00: Slave transmission 01: Slave reception 10: Master transmission 11: Master reception
Bit 7	PCMFSSEL	0x0	rw	PCM frame synchronization This bit is valid only when the PCM standard is used. 0: Short frame synchronization

				1: Long frame synchronization
Bit 6	Reserved	0x0	resd	Kept at its default value
Bit 5: 4	STDSEL	0x0	rw	I²S standard select 00: Philips standard 01: MSB-aligned standard (left-aligned) 10: LSB-aligned standard (right-aligned) 11: PCM standard
Bit 3	I2SCLKPOL	0x0	rw	I²S clock polarity This bit indicates the clock polarity on the clock pin in idle state. 0: Low 1: High
Bit 2: 1	I2SDBN	0x0	rw	I²S data bit num 00: 16-bit data length 01: 24-bit data length 10: 32-bit data length 11: Not allowed.
Bit 0	I2SCBN	0x0	rw	I²S channel bit num This bit can be configured only when the I²S is set to 16-bit data; otherwise, it is fixed to 32-bit by hardware. 0: 16-bit wide 1: 32-bit wide

13.4.9 SPI_I2S prescaler register (SPI_I2SCLKP)

Bit	Register	Reset value	Type	Description
Bit 15: 12	Reserved	0x0	resd	Forced to be 0
Bit 9	I2SMCLKOE	0x0	rw	I²S Master clock output enable 0: Disabled 1: Enabled
Bit 8	I2SODD	0x0	rw	IOdd factor for I²S division 0: Actual divider factor =I2SDIV*2； 1: Actual divider factor =(I2SDIV*2)+1。
Bit 11: 10 Bit 7: 0	I2SDIV	0x02	rw	I²S division It is not allowed to configure I2SDIV[9: 0]=0 or I2SDIV[9: 0]=1

14 Timer

AT32F413 timers include basic timers, general-purpose timers, and advanced-control timers. Please refer to *Section 14.1*~ *Section 14.3* for the detailed function modes. All functions of different timers are shown in the following tables.

Table 14-1 TMR functional comparison

Timer type	Timer	Counter bit	Count mode	Repetition	Prescaler	DMA requests	Capture/ compare channel	PWM input mode	EXT input	Break input
Advanced-control timer	TMR1 TMR8	16	Up Down Up/Down	8-bit	1~65535	O	4	O	O	O
General-purpose timer	TMR2 TMR5	16/32	Up Down Up/Down	X	1~65535	O	4	O	TMR2 only	X
	TMR3 TMR4	16	Up Down Up/Down	X	1~65535	O	4	O	TMR3 only	X
	TMR9	16	Up	X	1~65535	X	2	O	X	X
	TMR10 TMR11	16	Up	X	1~65535	X	1	X	X	X

Timer type	Timer	Counter bit	Count mode	PWM output	Single pulse output	Complementary output	Dead-time	Encoder interface connection	Interfacing with hall sensors	Linkage peripheral
Advanced-control timer	TMR1 TMR8	16	Up Down Up/Down	O	O	O	O	O	O	Timer syn./ADC
General-purpose timer	TMR2 TMR5	16/32	Up Down Up/Down	O	O	X	X	O	O	Timer syn./ADC
	TMR3 TMR4	16	Up Down Up/Down	O	O	X	X	O	O	Timer syn./ADC
	TMR9 TMR12	16	Up	O	O	X	X	X	X	Timer syn.
	TMR10 TMR11	16	Up	O	O	X	X	X	X	NA

14.1 General-purpose timer (TMR2 to TMR5)

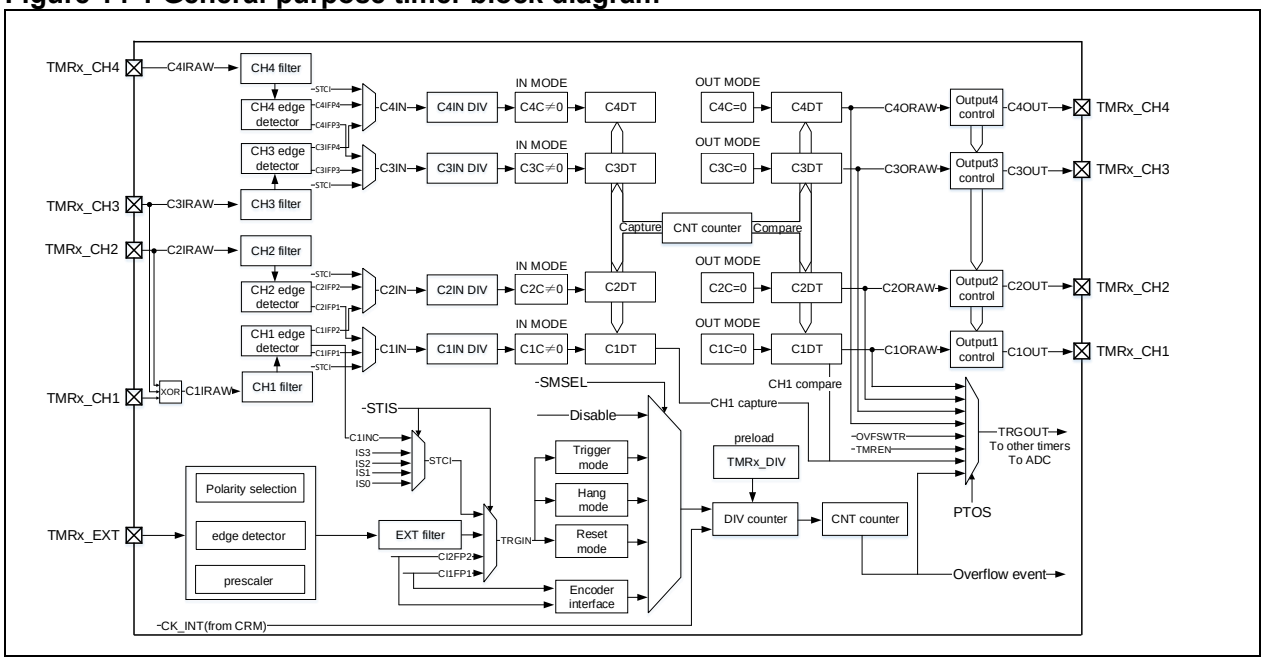
14.1.1 TMRx introduction

The general-purpose timer (TMR2 to TMR5) consists of a 16-bit counter supporting up, down, up/down (bidirectional) counting modes, four capture/compare registers, and four independent channels to achieve input capture and programmable PWM output.

14.1.2 TMRx main features

- Source of count clock is selectable: internal clock, external clock and internal trigger
- 16-bit up, down, up/down and encoder mode counter (TMR2/5 can be extended to 32-bit)
- 4 independent channels for input capture, output compare, PWM generation and one-pulse mode output
- Synchronization control between master and slave timers
- Interrupt/DMA is generated at overflow event, trigger event and channel event
- Support TMR burst DMA transfer

Figure 14-1 General-purpose timer block diagram

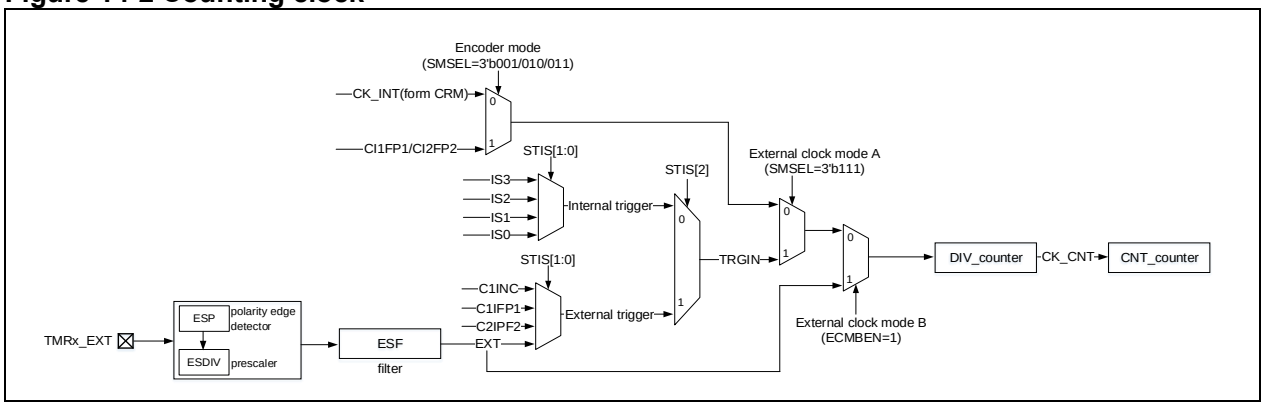


14.1.3 TMRx functional overview

14.1.3.1 Counting clock

The count clock of TMR2~TMR5 can be provided by the internal clock (CK_INT), external clock (external clock mode A and B) and internal trigger input (ISx)

Figure 14-2 Counting clock



Internal clock (CK_INT)

By default, the CK_INT divided by the prescaler is used to drive the counter to start counting. When TMR's APB clock prescaler factor is 1, the CK_INT frequency is equal to that of APB, otherwise, it doubles the APB clock frequency.

Configuration procedures:

- Select a counting mode by setting the TWCMSEL[1:0] in TMRx_CTRL1 register. If an unidirectional aligned counting mode is selected, it is necessary to select a counting direction through the OWCDIR in

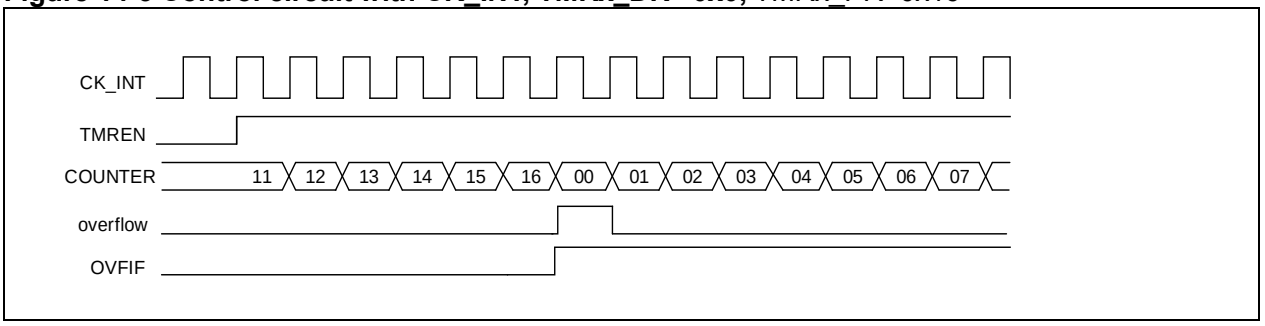
TMRx_CTRL1 register.

- Set counting frequency through TMRx_DIV register

-Set counting cycles through TMRx_PR register

- Eanble a counter by setting the TMREN bit in the TMRx_CTRL1 register

Figure 14-3 Control circuit with CK_INT, TMRx_DIV=0x0, TMRx_PR=0x16



External clock (TRGIN/EXT)

The counter clock can be provided by two external clock sources, namely, TRGIN and EXT signals.

SMSEL=3'b111: External clock mode A is selected. Select an external clock source TRGIN signal by setting the STIS[2: 0] bit to drive the counter to start counting.

The external clock sources include: C1INC (STIS=3'b100, channel 1 rising edge and falling edge), C1IFP1 (STIS=3'b101, the channel 1 signal with filtering and polarity selection), C2IFP2 (STIS=3'b110, a channel 2 signal with filtering and polarity selection) and EXT (STIS=3'b111, external input signal with polarity selection, frequency division and filtering).

ECMBEN=1: External clock mode B is selected. The counter is driven by external input that has gone through polarity selection, frequency division and filtering. The external clock mode B is equivalent to the external clock mode A which selects EXT signal as an external force TRGIN.

To use external clock mode A, follow the steps below:

-Set external source TRGIN parameters

If the TMRx_CH1 is used as a source of TRGIN, it is necessary to configure channel 1 input filter (C1DF[3:0] in TMRx_CM1 register) and channel 1 input polarity (C1P/C1CP in TMRx_CCTRL register);

If the TMRx_CH2 is used as source of TRGIN, it is necessary to configure channel 1 input filter (C2DF[3:0] in TMRx_CM1 register) and channel 2 input polarity (C2P/C2CP in TMRx_CCTR register);

If the TMRx_EXT is used as a source of TRGIN, it is necessary to configure the external signal polarity (ESP in TMRx_STCTRL register), external signal frequency division (ESDIV[1:0] in TMRx_STCTRL) and external signal filter (ESF[3:0] in TMRx_STCTRL register).

- Set TRGIN signal source using the STIS[1:0] bit in TMRx_STCTRL register

- Enable external clock mode A by setting SMSEL=3'b111 in TMRx_STCTR register

- Set counting frequency through the DIV[15:0] in TMRx_DIV register

- Set counting period through the PR[15:0] in TMRx_PR register

-Enable counter through the TMREN bit in TMRx_CTRL1 register

To use external clock mode B, follow the steps below:

-Set external signal polarity through the ESP bit in TMRx_STCTRL register

-Set external signal frequency division through the ESDIV[1:0] bit in TMRx_STCTRL register

-Set external signal filter through the ESF[3:0] bit in TMRx_STCTRL register

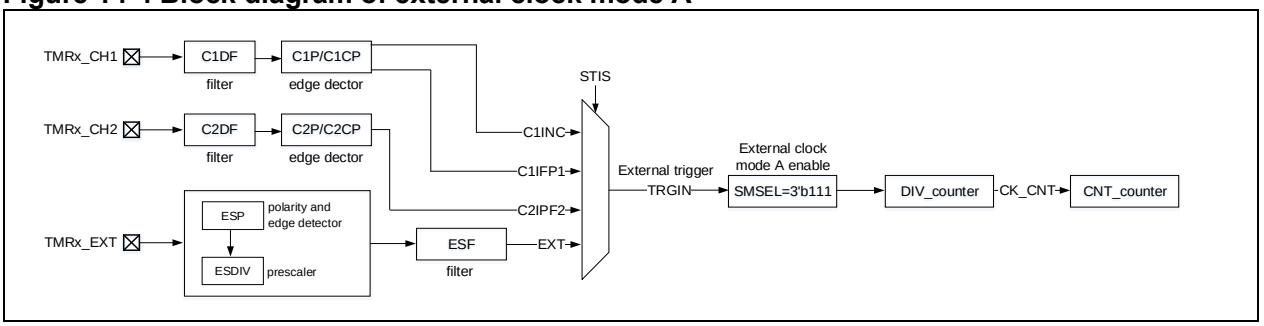
-Enable external clock mode B through the ECMBEN bit in TMRx_STCTR register

-Set counting frequency through the DIV[15:0] bit in TMRx_DIV register

-Set counting period through the PR[15:0] bit in TMRx_PR register

-Enable counter through the TMREN in TMRx_CTRL1 register

Figure 14-4 Block diagram of external clock mode A



Note: The delay between the signal on the input side and the actual clock of the counter is due to the synchronization circuit.

Figure 14-5 Counting in external clock mode A, PR=0x32, DIV=0x0

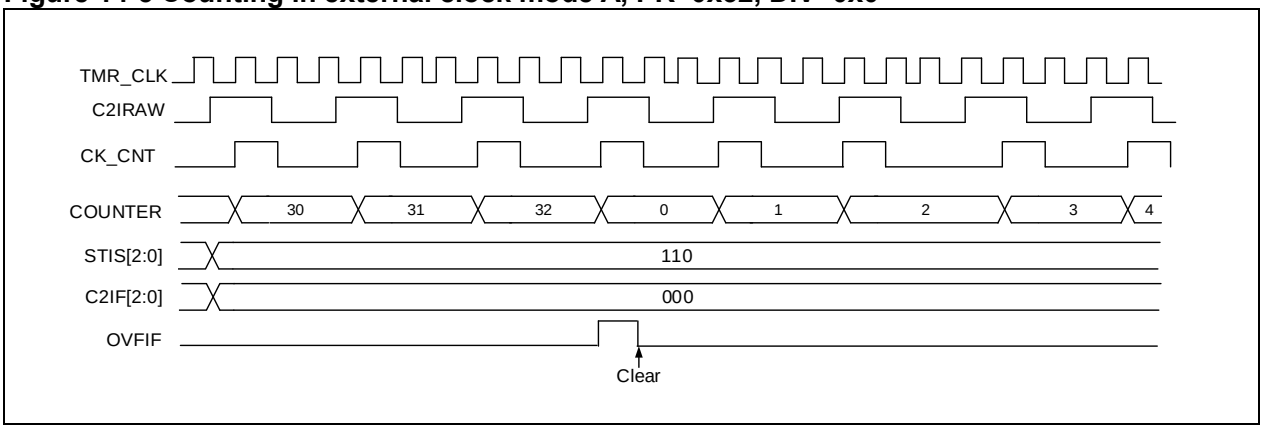


Figure 14-6 Block diagram of external clock mode B, PR=0x32, DIV=0x0

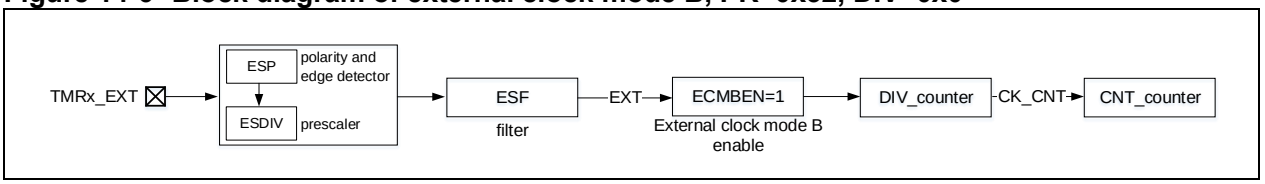
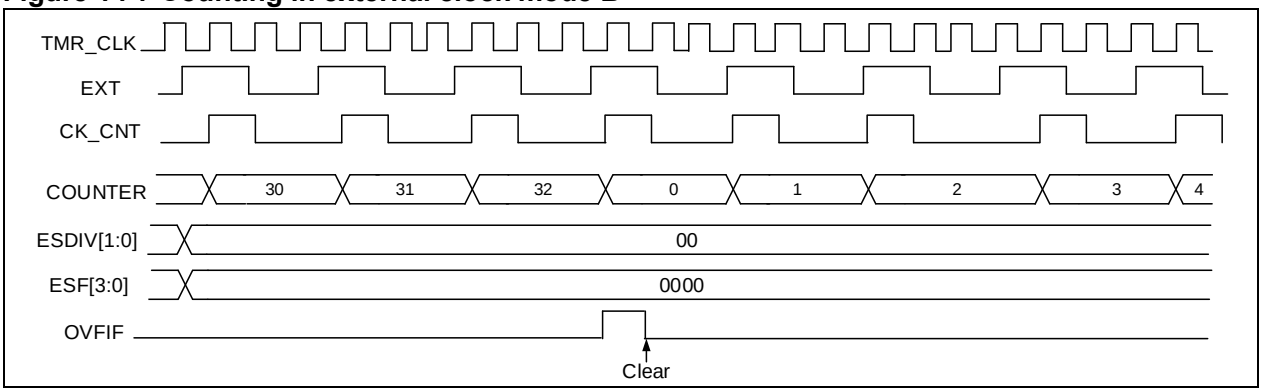


Note: The delay between the EXT signal on the input side and the actual clock of the counter is due to the synchronization circuit.

Figure 14-7 Counting in external clock mode B



Internal trigger input (ISx)

Timer synchronization allows interconnection between several timers. The TMR_CLK of one timer can be provided by the TRGOUT signal output by another timer. Set the STIS[2: 0] bit to select internal trigger signal to enable counting.

Each timer (TMR2 to TMR5) consists of a 16-bit prescaler, which is used to generate the CK_CNT that enables the counter to count. The frequency division relationship between the CK_CNT and TMR_CLK can be adjusted by setting the value of the TMRx_DIV register. The prescaler value can be modified at any time, but it takes effect only when the next overflow event occurs.

Below is the configuration procedure for interal trigger input:

- Set counting cycles through TMRx_PR register
- Set counting frequency through TMRx_DIV register
- Set counting modes through the TWCMSEL[1:0] in TMRx_CTRL1 register
- Select internal trigger by setting STIS[2:0]= 3'b000~3'b011 in TMRx_STCTRL register
- Select external clock mode A by setting SMSEL[2:0]=3'b111 in TMRx_STCTRL register
- Eable TMRx to start counting through the TMREN in TMRx_CTRL1 register

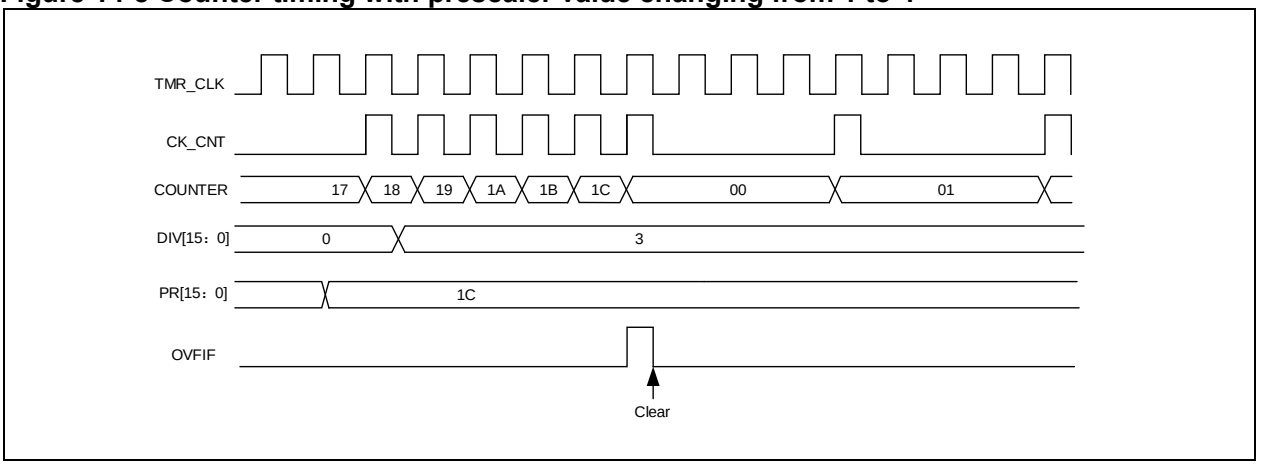
Table 14-2 TMRx internal trigger connection

Slave controler	IS0 (STIS = 000)	IS1 (STIS = 001)	IS2 (STIS = 010)	IS3 (STIS = 011)
TMR2	TMR1	TMR8/USB_SOF(2)	TMR3	TMR4
TMR3	TMR1	TMR2	TMR5	TMR4
TMR4	TMR1	TMR2	TMR3	TMR8
TMR5	TMR2	TMR3	TMR4	TMR8

Note 1: If there is no corresponding timer in a device, the corresponding trigger signal ISx is not present.

Note 2: TMR8 or USB_SOF is available for IS1 to select, depending on the TMR2IS1_IRMP bit of the IOMUX_MAP4 register.

Figure 14-8 Counter timing with prescaler value changing from 1 to 4



14.1.3.2 Counting mode

The timer (TMR2 to TMR5) supports several counting modes to meet different application scenarios. Each timer has an internal 16-bit up, down, up/down counter. TMR2/5 can be extended to 32-bit by setting the PMEN bit. The TMRx_PR register is loaded with the counter value.

The value in the TMRx_PR is immediately moved to the shadow register by deault. When the periodic buffer is enabled (PRBEN=1), the value in the TMRx_PR register is transferred to the shadow register only at an overflow event.

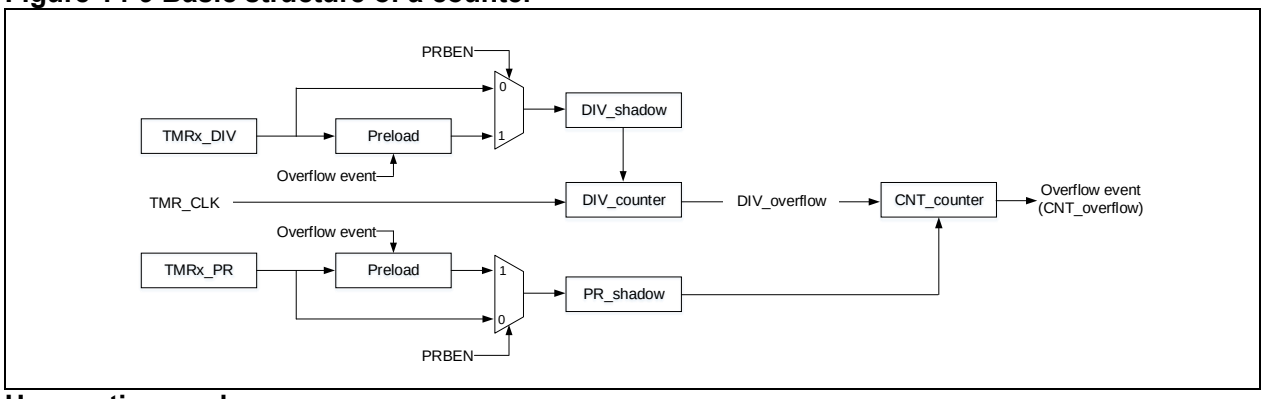
TMRx_DIV register is used to define the counter frequency of the counter. The counter counts once every DIV[15:0]+1 clock cycle. Similar to TMRx_PR register, after enabling periodic buffer, the value of the TMRx_DIV register are transferred into the shadow register at each overflow event.

Reading the TMRx_CNT register returns the current counter value. Writing the TMRx_CNT register will update the current counter value.

An overflow event is is enabled by default. It can be disabled by setting OVFEN=1 in the TMRx_CTRL1 register. The OVFS bit in the TMRx_CTRL1 register is used to select the source of an overflow event, which is, by default, counter overflow or underflow, setting OVFSWTR, reset signal generated by slave mode timer controller in reset mode. Once the OVFS is set, an overflow event is generated only when overflow or underflow occurs.

Settng the TMREN bit (TMREN=1) enables the timer to start counting. Base on synchronization logic, however, the actual enable signal TMR_EN is set 1 clock cycle after the TMREN is set.

Figure 14-9 Basic structure of a counter



Upcounting mode

This uncounting mode is enabled by setting CMSEL[1:0]=2'b00 and OWCDIR=1'b0 in the TMRx_CTRL1 register.

In upcounting mode, the counter counts from 0 to the value programmed in the TMRx_PR register, then restarts from 0, and generates a counter overflow event, with the OVFIF bit being set to 1. If the overflow event is disabled, the counter is no longer reloaded with the preload value and period value at a counter overflow event, otherwise, the counter is updated with the preload value and period value on an overflow event.

Figure 14-10 Overflow event when PRBEN=0

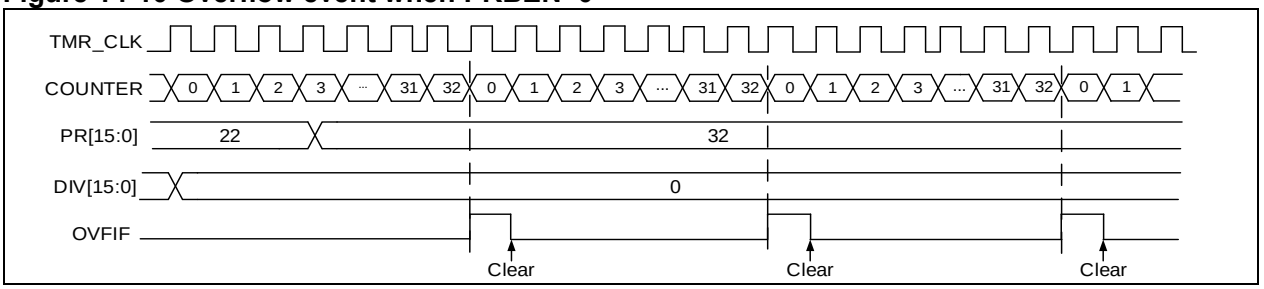


Figure 14-11 Overflow event when PRBEN=1

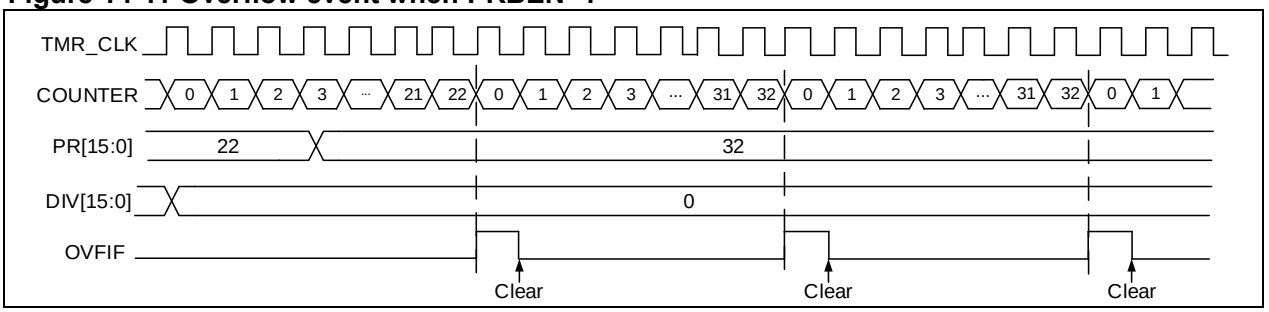
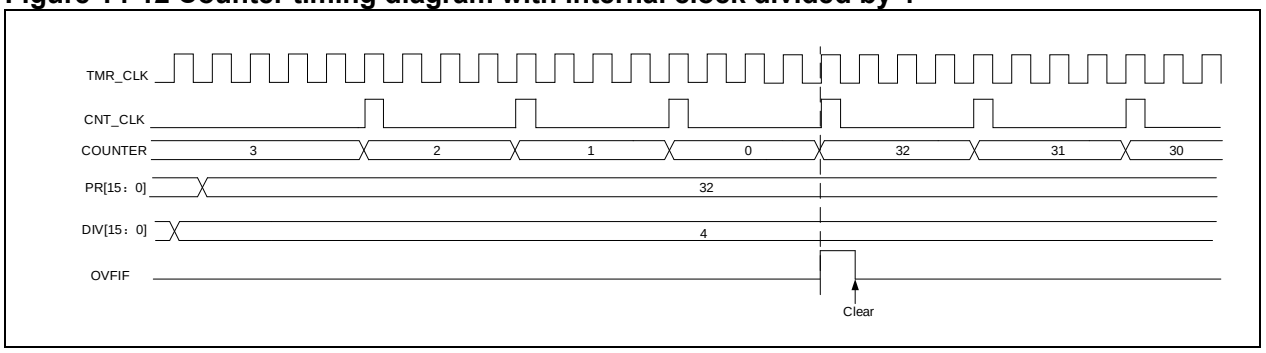


Downcounting mode

This mode is enabled by setting CMSEL[1:0]=2'b00 and OWCDIR=1'b1 in the TMRx_CTRL1 register.

In downcounting mode, the counter counts from the value programmed in the TMRx_PR register down to 0, and restarts from the value programmed, and generates a counter underflow event.

Figure 14-12 Counter timing diagram with internal clock divided by 4



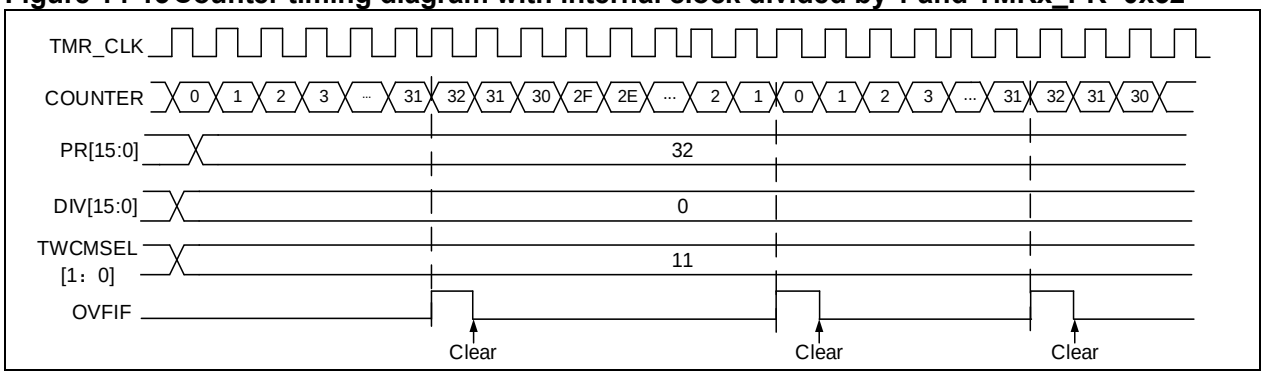
Up/down counting mode (center-aligned mode)

Up/down counting mode can be enabled by setting CMSEL[1:0]≠2'b00 in the TMRx_CTRL1 register. In up/down counting mode, the counter counts up/down alternatively. When the counter counts from the value programmed in the TMRx_PR register down to 1, an underflow event is generated, and then restarts counting from 0; When the counter counts from 0 to the value of the TMRx_PR register -1, an overflow event is generated, and then restarts counting from the value of the TMRx_PR register. The OWCDIR bit indicates the current counting direction.

The TWCMSEL[1:0] bit in the TMRx_CTRL1 register is used to select the condition under which the CxIF flag is set in two-way counting mode. In other words, when TWCMSEL[1:0]=2'b01 (counting mode 1) is selected, the CxIF flag is set only when the counter counts down; when TWCMSEL[1:0]=2'b10 (counting mode 2) is selected, the CxIF flag is set only when the counter counts up; when TWCMSEL[1:0]=2'b11 (counting mode 3) is selected, the CxIF flag is set when the counter counts up and down.

Note: The OWCDIR is ready-only in up/down counting mode.

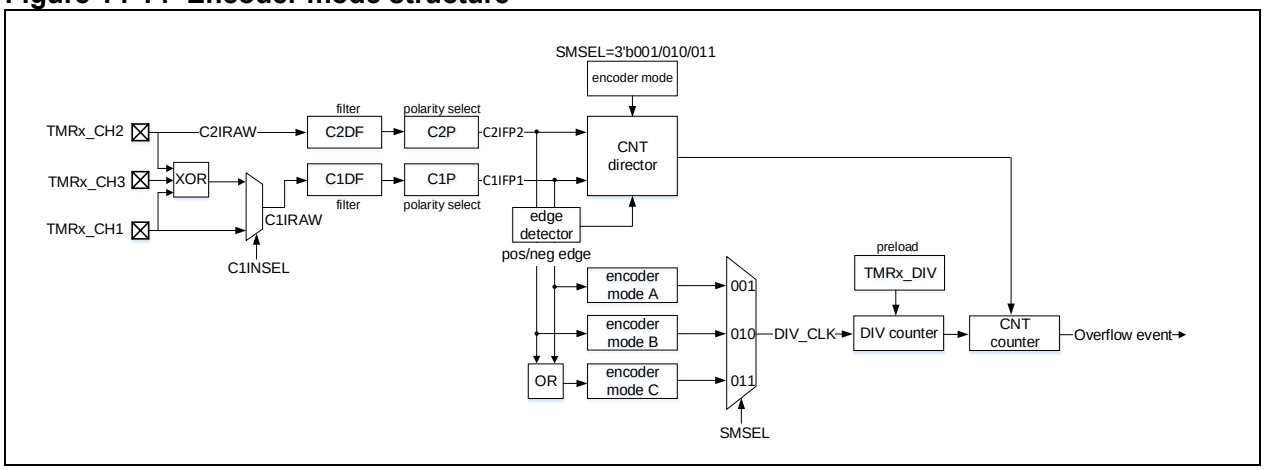
Figure 14-13 Counter timing diagram with internal clock divided by 1 and TMRx_PR=0x32



Encoder interface mode

In this mode, the two input (TMRx_CH1 and TMRx_CH2) signals are required. Depending on the level on one input, the counter counts up or down on the edge of the other input signal. The OWCDIR bit indicates the direction of the counter, as shown in the table below:

Figure 14-14 Encoder mode structure



Encoder mode A: SMSEL=3'b001. The counter counts on the selected C1IFP1 edge (rising and falling edges), and the counting direction is dependent on the edge direction of C1IFP1 and the level of C2IFP2.

Encoder mode B: SMSEL=3'b010. The counter counts on the selected C2IFP2 edge (rising and falling edges), and the counting direction is dependent on the edge direction of C2IFP2 and the level of C1IFP1.

Encoder mode C: SMSEL=3'b011. The counter counts on both C1IFP1 and C2IFP2 edges (rising and falling edges). The counting direction is dependent on the C1IFP1 edge direction and C2IFP2 level, and C2IFP2 edge direction and C1IFP1 level.

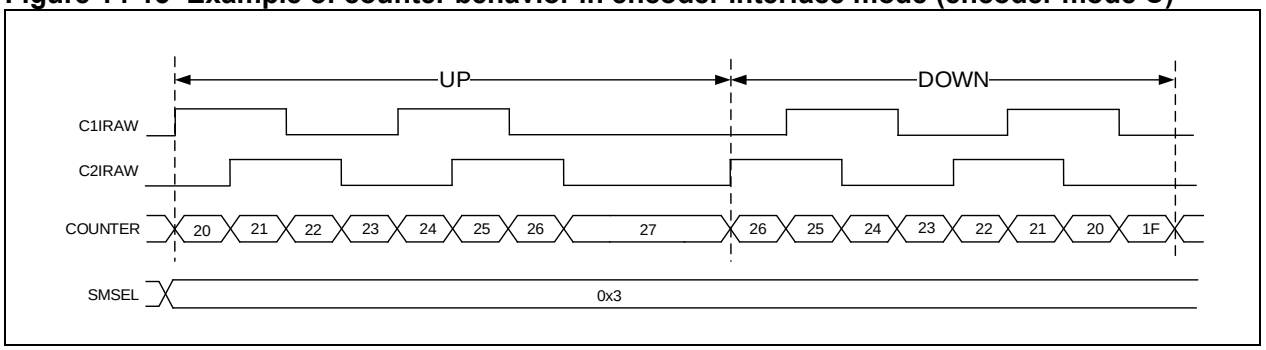
To use encoder mode, follow the procedures below:

- Set channel 1 input signal filtering through the C1DF[3:0] bit in the TMRx_CM1 register;
  Set channel 1 input signal active level through the C1P bit in the TMRx_CCTRL register
- Set channel 2 input signal filtering through the C2DF[3:0] bit in the TMRx_CM1 register;
  Set channel 2 input signal active level through the C2P bit in the TMRx_CCTRL register
- Set channel 1 as input mode through the C1C[1:0] bit in the TMRx_CM1 register;
  Set channel 2 as input mode through the C2C[1:0] bit in the TMRx_CM1 register
- Select encoder mode A (SMSEL=3'b001), encoder mode B (SMSEL=3'b010), or encoder mode C (SMSEL=3'b011) by setting the SMSEL[2:0] bit in the TMRx_STCTRL register
- Set counting cycles through the PR[15:0] bit in the TMRx_PR register
- Set counting frequency through the DIV[15:0] bit in the TMRx_DIV register
- Configure the corresponding IOs of TMRx_CH1 and TMRx_CH2 as multiplexed mode
- Enable counter through the TMREN bit in the TMRx_CTRL1 register

Table 14-3 Couting direction versus encoder signals

Active edge	Level on opposite signal (**C1INFP1 to** C2IFP2, **C2INFP2 to** C1IFP1)	**C1INFP1 signal**		**C2INFP2 signal**	
		Rising	**Falling**	**Rising**	**Falling**
Count on C1IFP1 only	High	Down	Up	No count	No count
	Low	Up	Down	No count	No count
Count on C2IFP2 only	High	No count	No count	Up	Down
	Low	No count	No count	Down	Up
Count on both C1IFP1 and C2IFP2	High	Down	Up	Up	Down
	Low	Up	Down	Down	Up

Figure 14-15 Example of counter behavior in encoder interface mode (encoder mode C)



14.1.3.3 TMR input function

Each of TMR2~TMR5 timers has four independent channels, each of which can be configured as input or output. As input, each channel input signal is processed as follows:

- TMRx_CHx outputs the pre-processed CxIRAW. The C1INSEL bit is used to select the source of C1IRAW from TMRx_CH1 or the XOR-ed TMRx_CH1, TMRx_CH2 and TMRx_CH3.

  The sources of C2IRAW, C3IRAW and C4IRAW are TMRx_CH2, TMRx_CH3 and TMRx_CH4, respectively.
- CxIRAW inputs digital filter and outputs filtered CxIF signal. The digital filter uses the CxDF bit to program sampling frequency and sampling times.
- CxIF inputs edge detector, and outputs the CxIFPx signal after edge selection. The edge selection depends on both CxP and CxCP bits. It is possible to select input rising edge, falling edge or both edges.
- CxIFPx inputs capture signal selector, and outputs the CxIN signal after capture signal selection. The capture signal selection is defined by CxC bit. It is possible to select CxIFPx, CyIFPx or STCI as CxIN source. Of those, CyIFPx (x≠y) is the CyIFPy signal that is from Y channel and processed by channel-x edge detector (for example, C1IFP2 is the channel 1's C1IFP1 signal that passed through channel 2 edge detection). The STCI comes from slave timer controller, and its source is selected by STIS bit.
- CxIN outputs the CxIPS signal that is divided by input channel divider. The divider factor can be defined as No division, /2, /4 or /8, by the CxIDIV bit. It can be used for filtering, selection, division and input capture of input signals.

Figure 14-16 Input/output channel 1 main circuit

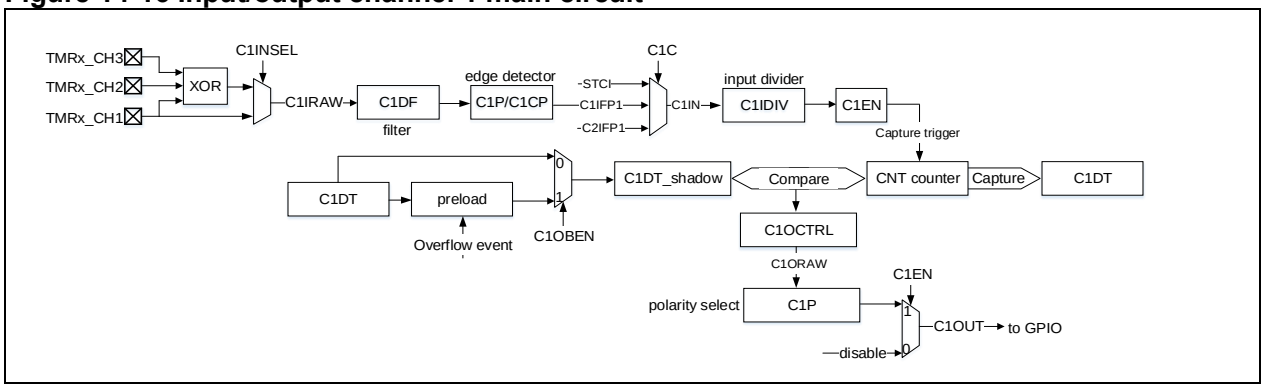


Figure 14-17 Channel 1 input stage

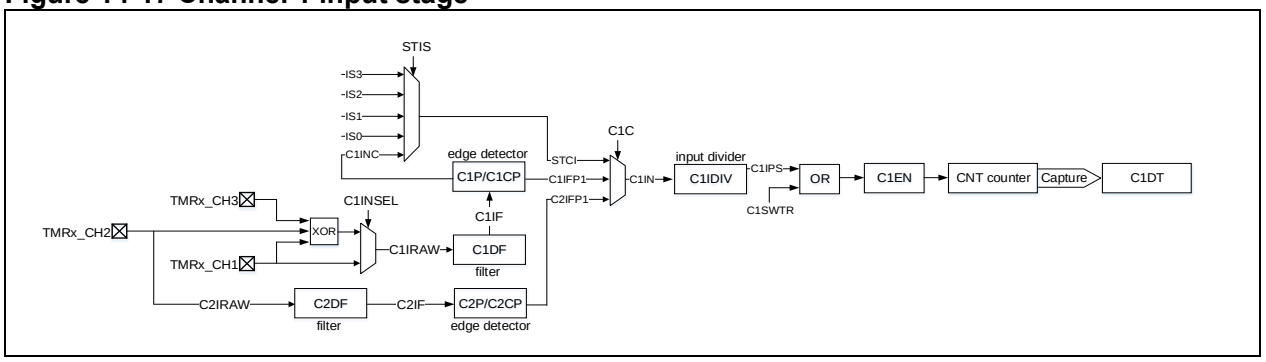

Input mode

In input mode, the TMRx_CxDT registers latch the current counter values after the selected triggle signal is detected, and the capture compare interrupt flag bit (CxIF) is set. An interrupt or a DMA request will be generated if the CxIEN and CxDEN bits are enabled. If the selected trigger signal is detected when the CxIF is set, the CxRF is set.

To capture the rising edge of C1IN input, following the configuration procedure mentioned below:

- Set C1C=01 in the TMRx_CM1 register to select the C1IN as channel 1 input
- Set the filter bandwidth of C1IN signal (CxDF[3: 0])
- Set the active edge on the C1IN channel by writing C1P=0 (rising edge) in the TMRx_CCTR register
- Program the capture frequency of C1IN signal (C1DIV[1: 0])
- Enable channel 1 input capture (C1EN=1)
- If needed, enable the relevant interrupt or DMA request by setting the C1IEN bit in the TMRx_IDEN register or the C1DEN bit in the TMRx_IDEN register

Timer Input XOR function

The 3 timer input pins (TMRx_CH1, TMRx_CH2 and TMRx_CH3) are connected to the channel 1 (selected by setting the C1INSE in the TMRx_CTRL2 register) through an XOR gate.

The XOR gate can be used to connect Hall sensors. For example, connect the three XOR inputs to the three Hall sensors respectively so as to calculate the position and speed of the rotation by analyzing three Hall sensor signals.

PWM input

PWM input mode is applied to channel 1 and 2. To use this mode, both C1IN and C2IN are mapped on to the same TMRx_CHx, and the CxIFPx of either channel 1 or channel 2 must be configured as trigger input and slave mode controller is configured in reset mode.

The PWM input mode can be used to measure the period and duty cycle of the PWM input signal. For example, the user can measure the period and duty cycle of the PWM applied on channel 1 using the following procedures:

- Set C1C=2‘b01: select C1IN for C1IFP1
- Set C1P=1’b0, select C1IFP1 rising edge active
- Set C2C=2‘b10, select C2IN for C1IFP2
- Set C2P=1’b1, select C1IFP2 falling edge active
- Set STIS=3’b101, select the slave mode timer trigger singal as C1IFP1
- Set SMSEL=3‘b100: configure the slave mode controller in reset mode
- Set C1EN=1’b1 and C2EN=1’b1. Enable channel 1 and input capture

After above configuration, the rising edge of channel 1 input signal will trigger the capture and stores the capture value into C1DT register, and it will reset the counter at the same time. The falling edge of the channel 1 input signal triggers the capture and stores the capture value into C2DT register. The period of the channel 1 input signal is calculated through C1DT, and its duty cycle through C2DT.

Figure 14-18 PWM input mode configuration example

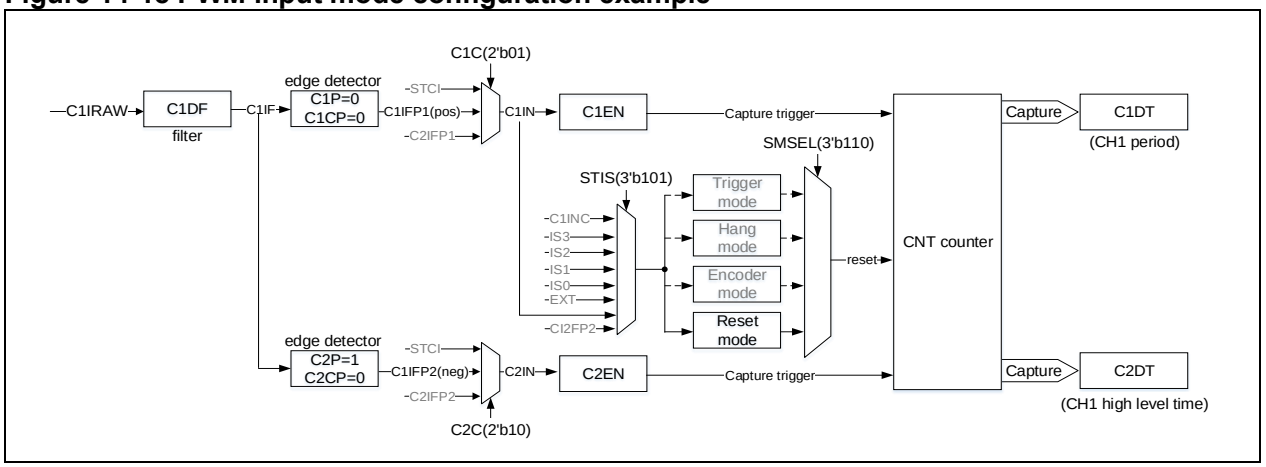

Figure 14-19 PWM input mode

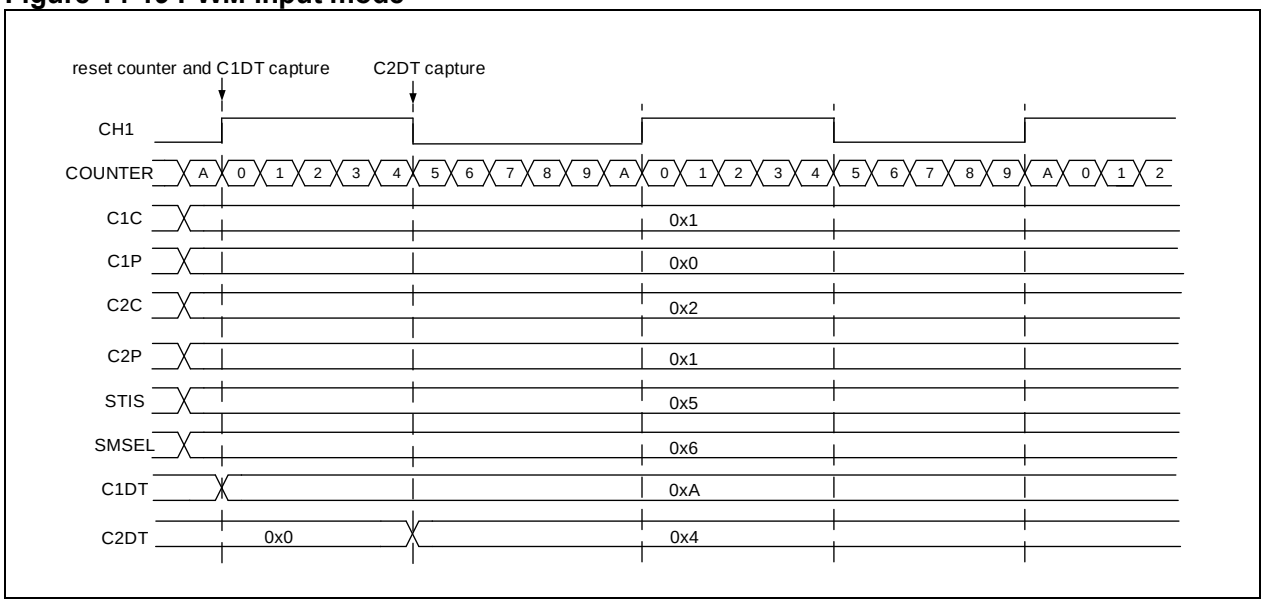
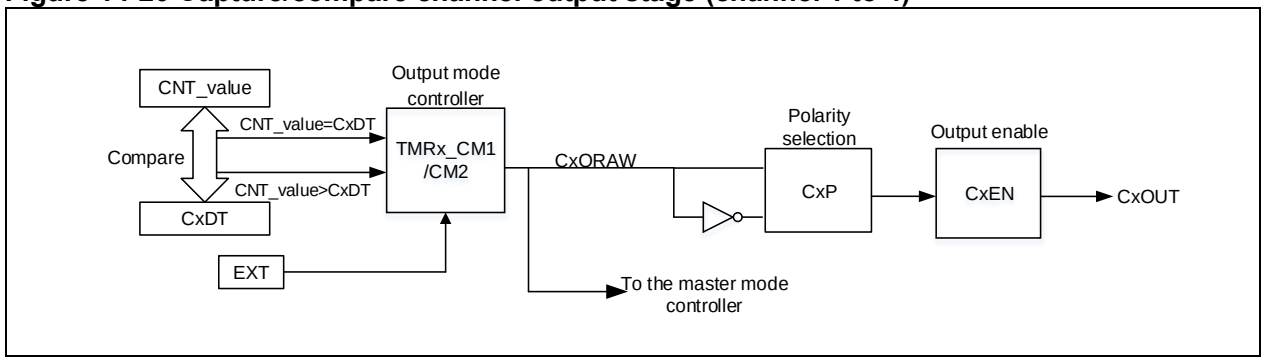


14.1.3.4 TMR output function

The TMR output consists of a comparator and an output controller. It is used to program the period, duty cycle and polarity of the output signal.

Figure 14-20 Capture/compare channel output stage (channel 1 to 4)



Output mode

Write CxC[2: 0]≠2'b00 to configure the channel as output to implement multiple output modes. In this case, the counter value is compared with the value in the TMRx_CxDT register, and the intermediate signal CxORAW is generated according to the output mode selected by CxOCTRL[2: 0], which is sent to IO after being processed by the output control circuit. The period of the output signal is configured by the TMRx_PR register, while the duty cycle by the TMRx_CxDT register.

Output compare modes include:

PWM mode A:
Enable PWM mode A by setting CxOCTRL=3'b110. In upcounting mode, C1ORAW outputs high when TMRx_C1DT>TMRx_CVAL, otherwise, it is low; In downcounting mode, C1ORAW outputs low when TMRx_C1DT<TMRx_CVAL, otherwise, it is high.
To use PWM mode A, the following procedures are recommended:

- Set PWM periods throug TMRx_PR register
- Set PWM duty cycles through TMRx_CxD
- Select PWM mode A by setting CxOCTRL=3'b110 in the TMRx_CM1/CM2 register
- Set counting frequency through TMRx_DIV register
- Select counting mode by setting the TWCMSEL[1:0] bit in the TMRx_CTRL1 register
- Select output polarity through the CxP and CxCP bits in the TMRx_CCTRL register
- Enable channel output through the CxEN and CxCEN bits in the TMRx_CCTRL register
- Enable TMRx output through the OEN bit in the TMRx_BRK register
- Configure GPIOs corresponding to TMR output channels as multiplexed mode
- Enable TMRx to start counting through the TMREN bit in the TMRx_CTRL1 register.

PWM mode B:
Enable PWM mode B by setting CxOCTRL=3'b111. In upcounting mode, C1ORAW outputs low when TMRx_C1DT>TMRx_CVAL, otherwise, it is high; In downcounting mode, C1ORAW outputs high when TMRx_C1DT<TMRx_CVAL, otherwise, it is low.
Forced output mode:
Enable forced output mode by setting CxOCTRL=3'b100/101. In this case, the CxORAW is forced to be the programmed level, regardless of the counter value. Despite this, the channel flag bit and DMA request still depend on the compare result.
Output compare mode:
Enable output compare mode by setting CxOCTRL=3'b001/010/011. In this case, when the counter value matches the value of the CxDT register, the CxORAW is forced high (CxOCTRL=3'b001), low (CxOCTRL=3'b010) or toggling (CxOCTRL=3'b011).
One-pulse mode：
This is a particular case of PWM mode. Enable one-pulse by setting OCMEN=1. In this mode, the comparison match is performed in the current counting period. The TMREN bit is cleared as soon as the current counting is completed. Therefore, only one pulse is output. When configured in upcounting mode, the configureation must follow the rule: CVAL<CxDT≤PR; in downcounting mode, CVAL>CxDT is required.
Fast output mode:
Enable this mode by setting CxOIEN=1. If enabled, the CxORAW signal will not change when the counter value matches the CxDT, but change at the beginning of the current counting period. In other words, the comparison result is advanced, so the comparison result between the counter value and the TMRx_CxDT register will determine the level of CxORAW in advance.
Figure 14-21 gives an example of output compare mode (toggle) with C1DT=0x3. When the counter value is equal to 0x3, C1OUT toggles.

Figure 14-22 gives an example of the combination between upcounting mode and PWM mode A. The output signal behaves when PR=0x32 but CxDT is configured with a different value.

Figure 14-23 gives an example of the combination between up/down counting mode and PWM mode A. The output signal behaves when PR=0x32 but CxDT is configured with a different value.

Figure 14-24 gives an example of the combination between upcounting mode and one-pulse PWM mode B. The counter only counts only one cycle, and the output signal sents only one pulse.

Figure 14-21 C1ORAW toggles when counter value matches the C1DT value

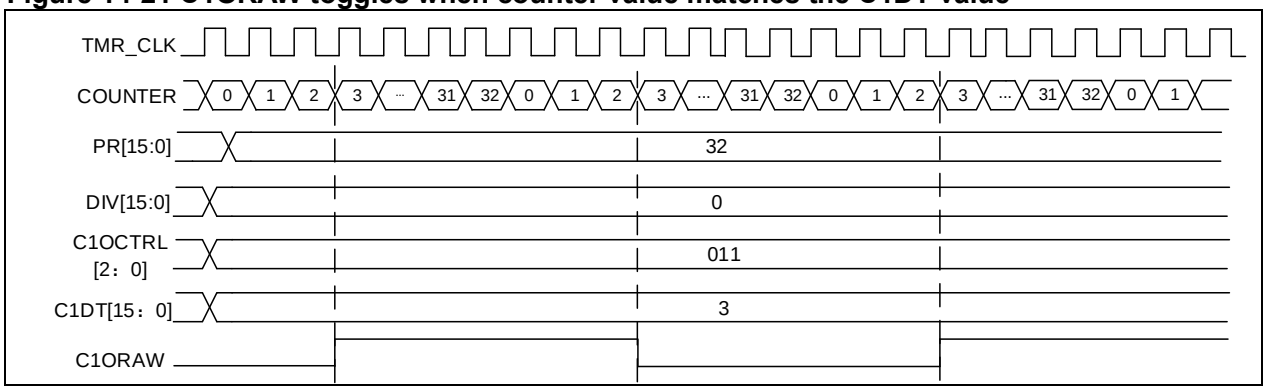


Figure 14-22 Upcounting mode and PWM mode A

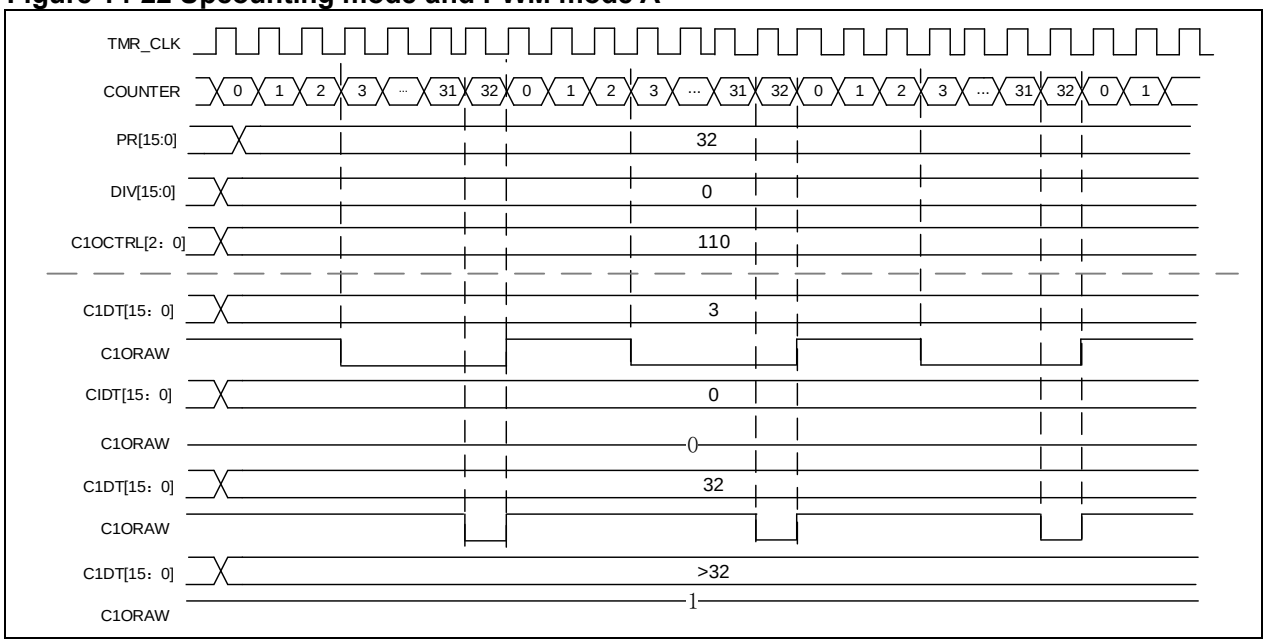

Figure 14-23 Up/down counting mode and PWM mode A

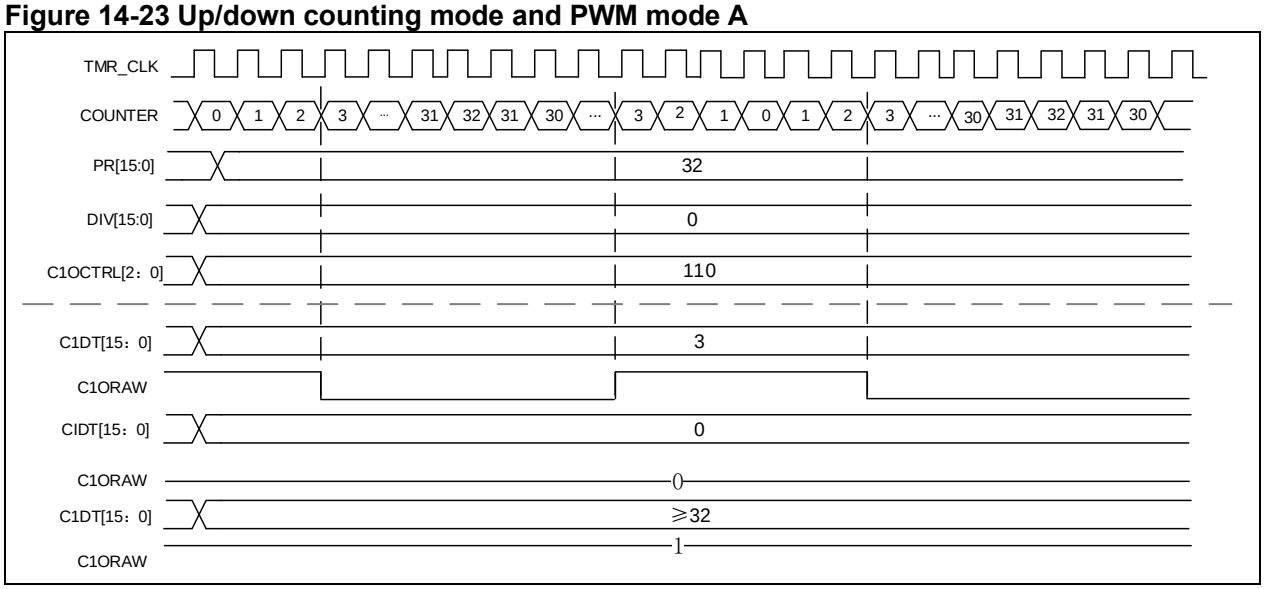

Figure 14-24 One-pulse mode

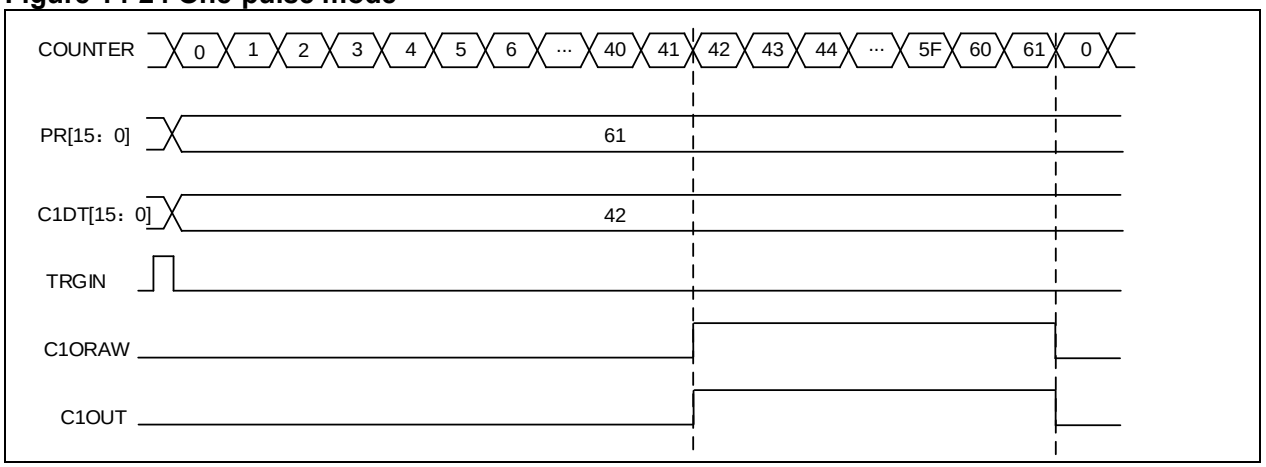


Master mode timer event output

When TMR is used as a master timer, one of the following source of sigals can be selected as TRGOUT output to a slave mode timer. This is done by setting the PTOS bit in the TMRxCTRL2 register.

-PTOS=3'b000, TRGOUT output software overflow event (OVFSWTR bit in TMRx_SWEVT register)

-PTOS=3'b001, TRGOUT output counter enable

-PTOS=3'b010, TRGOUT output counter overflow event

-PTOS=3'b011, TRGOUT output capture and compare event

-PTOS=3'b100, TRGOUT output C1ORAW

-PTOS=3'b101, TRGOUT output C2ORAW

-PTOS=3'b110, TRGOUT output C3ORAW

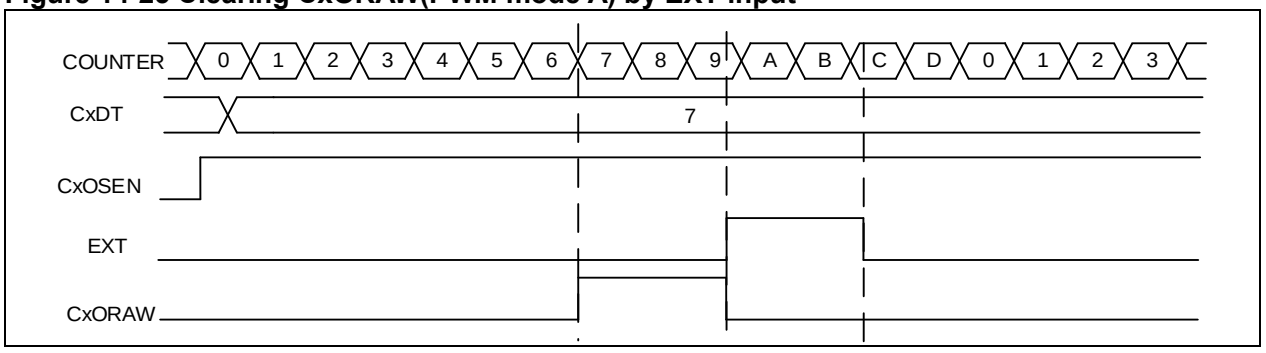
-PTOS=3'b111, TRGOUT output C4ORAW

CxORAW clear

When the CxOSEN bit is set, the CxORAW signal for a given channel is cleared by applying a high level to the EXT input. The CxORAW signal remains unchanged until the next overflow event.

This function can only be used in output capture or PWM modes, and does not work in forced mode. *Figure 14-25* shows the example of clearing CxORAW signal. When the EXT input is high, the CxORAW signal, which was originally high, is driven low; when the EXT is low, the CxORAW signal outputs the corresponding level according to the comparison result between the counter value and CxDT value.

Figure 14-25 Clearing CxORAW(PWM mode A) by EXT input



14.1.3.5 TMR synchronization

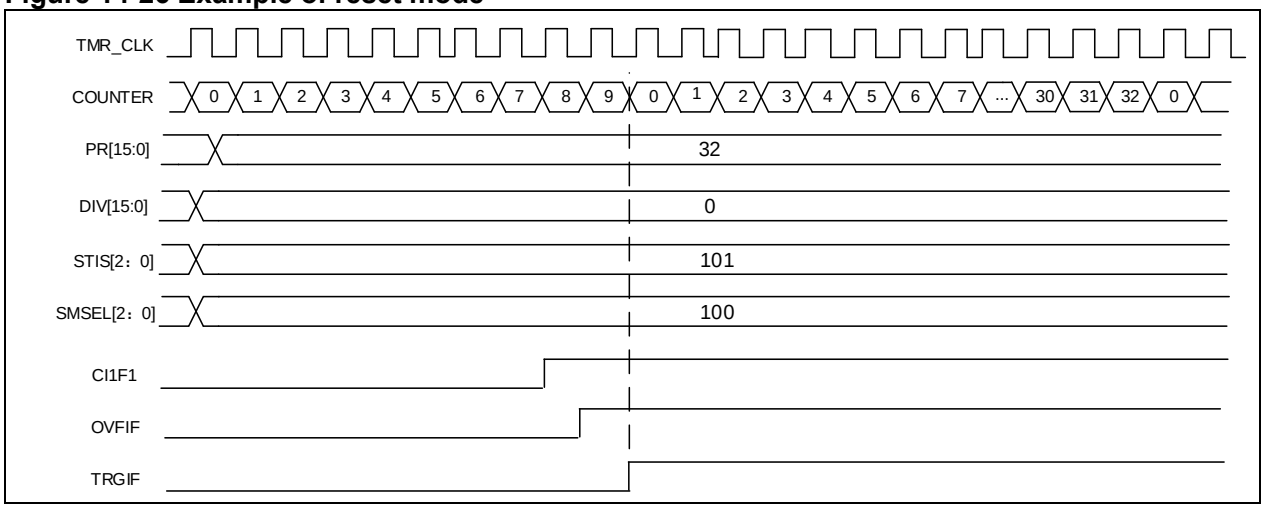
The timers are linked together internnaly for timer synchronization. Master timer is selected by setting the PTOS[2: 0] bit; Slave timer is selected by setting the SMSEL[2: 0] bit.

Slave mode include:

Slave mode: Reset mode

The counter and its prescaler can be reset by a selected trigger signal. An overflow event is generated when OVFS=0.

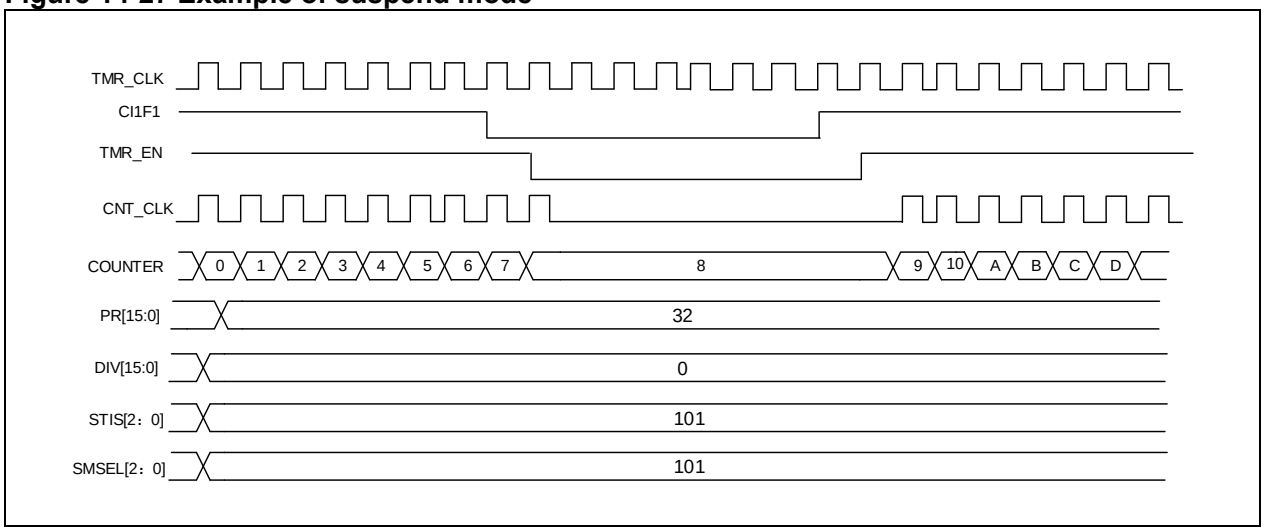
Figure 14-26 Example of reset mode



Slave mode: Suspend mode

In this mode, the counter is controlled by a selected trigger input. The counter starts counting when the trigger input is high and stops as soon as the trigger input is low.

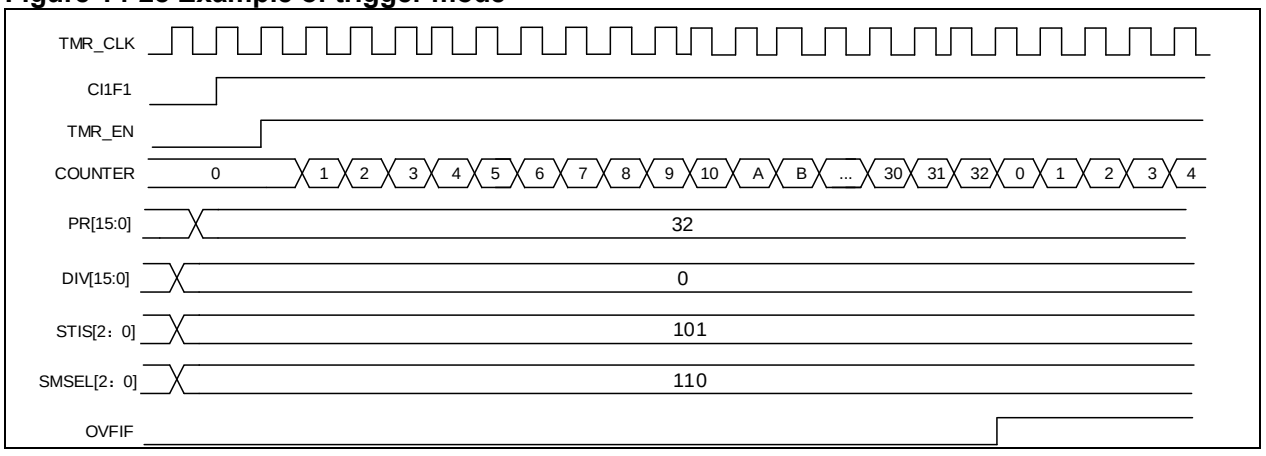
Figure 14-27 Example of suspend mode



Slave mode: Trigger mode

The counter can start counting on the rising edge of a selected trigger input (TMR_EN=1)

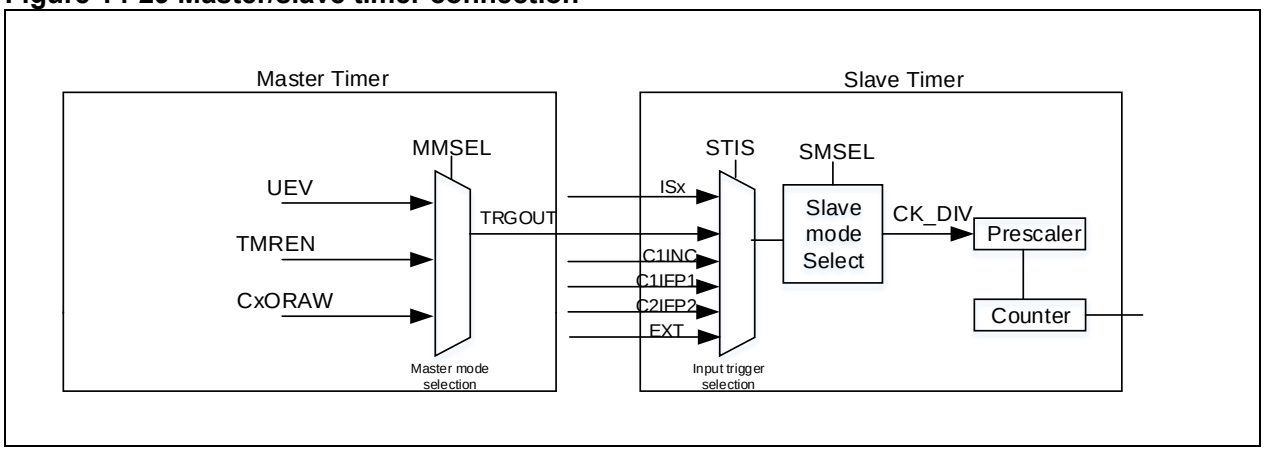
Figure 14-28 Example of trigger mode



Master/slave timer interconnection

Both Master and slave timer can be configured in different master and slave modes respectively. The combination of both them can be used for various purposes. Figure 14-24 provides an example of interconnection between master timer and slave timer.

Figure 14-29 Master/slave timer connection



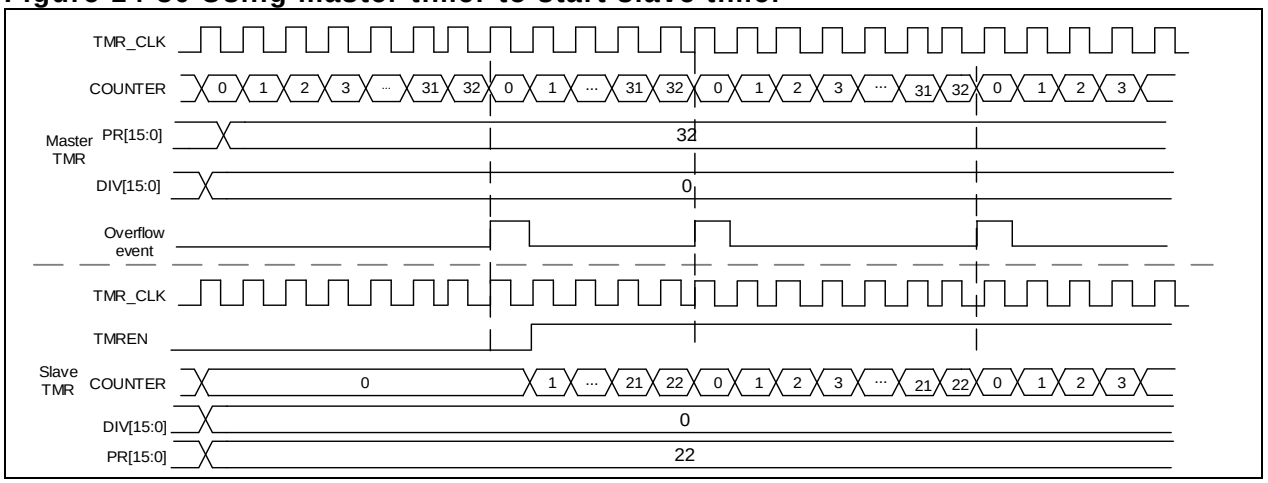
Using master timer to clock the slave timer:

- Configure master timer output signal TRGOUT as an overflow event (PTOS[2: 0]=3'b010). The master timer outputs a pulse signal at each counter overflow event, which is used as the counting clock of the slave timer.
- Configure the master timer counting period (TMRx_PR registers)
- Configure the slave timer trigger input signal TRGIN as master timer output (STIS[2: 0] in the TMRx_STCTRL register)
- Configure the slave timer to use external clock mode A (SMSEL[2: 0]=3'b111 in the TMRx_STCTRL register)
- Set TMREN =1 in both master timer and slave timer to enable them

Using master timer to start slave timer:

- Configure master timer output signal TRGOUT as an overflow event (PTOS[2: 0]=3'b010). The master timer outputs a pulse signal at each counter overflow event, which is used as the counting clock of the slave timer.
- Configure master timer counting period (TMRx_PR registers)
- Configure slave timer trigger input signal TRGIN as master timer input
- Configure slave timer as trigger mode (SMSEL=3'b110 in the TMR2_STCTRL register)
- Set TMREN=1 to enable master timer.

Figure 14-30 Using master timer to start slave timer



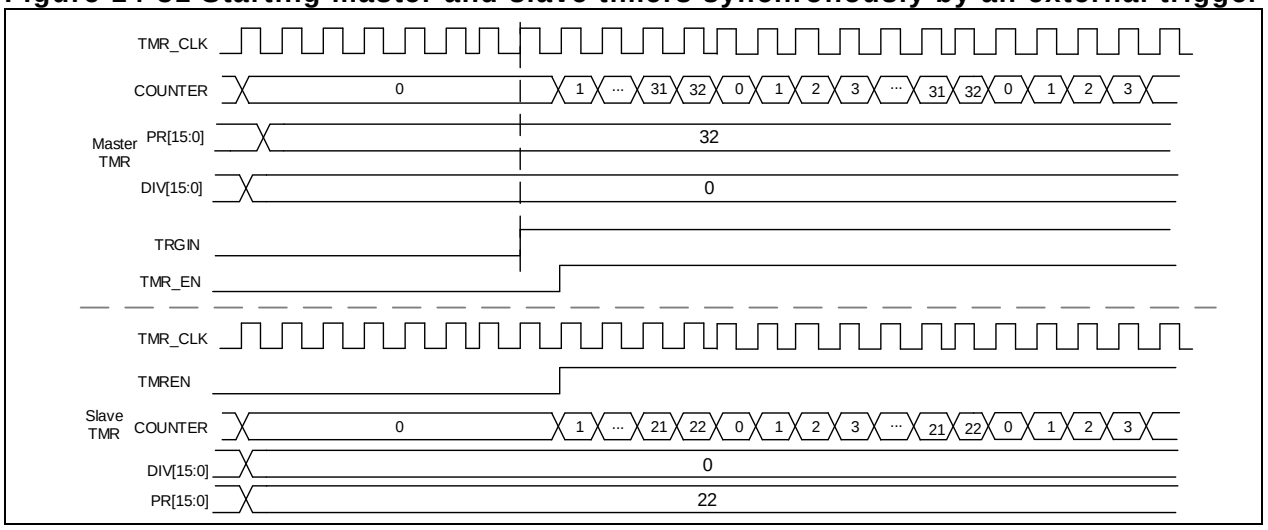
Starting master and slave timers synchronously by an external trigger:

In this example, configure the master timer as master/slave mode synchronously and enable its slave timer synchronization function. This mode is used for synchronization between master timer and slave timer.

- Set the STS bit of the master timer.

- Configure master timer output signal TRGOUT as an overflow event (PTOS[2: 0]=3'b010). The master timer outputs a pulse signal at each counter overflow event, which is used as the counting clock of the slave timer.
- Configure the slave timer mode of the master timer as trigger mode, and select C1IN as trigger source
- Configure slave timer trigger input signal TRGIN as master timer output
- Configure slave timer as trigger mode (SMSEL=3'b110 in the TMR2_STCTRL register)

Figure 14-31 Starting master and slave timers synchronously by an external trigger



14.1.3.6 Debug mode

When the microcontroller enters debug mode (Cortex®-M4F core halted), the TMRx counter stops counting by setting the TMRx_PAUSE in the DEBUG module.

14.1.4 TMRx registers

These peripheral registers must be accessed by word (32 bits).

All TMRx register are mapped into a 16-bit addressable space.

Table 14-4 TMRx register map and reset value

Register	Offset	Reset value
TMRx_CTRL1	0x00	0x0000
TMRx_CTRL2	0x04	0x0000

14.1.4.5 Interrupt status register (TMRx_ISTS)

Bit	Register	Reset value	Type	Description
Bit 15: 13	Reserved	0x0	resd	Kept at its default value
Bit 12	C4RF	0x0	rw0c	Channel 4 recapture flag Please refer to C1RF description.
Bit 11	C3RF	0x0	rw0c	Channel 3 recapture flag Please refer to C1RF description.
Bit 10	C2RF	0x0	rw0c	Channel 2 recapture flag Please refer to C1RF description.
Bit 9	C1RF	0x0	rw0c	Channel 1 recapture flag This bit indicates whether a recapture is detected when C1IF=1. This bit is set by hardware, and cleared by writing “0”. 0: No capture is detected 1: Capture is detected.
Bit 8: 7	Reserved	0x0	resd	Kept at its default value
Bit 6	TRGIF	0x0	rw0c	Trigger interrupt flag This bit is set by hardware on a trigger event. It is cleard by writing “0”. 0: No trigger event occurs 1: Trigger event is generated. Trigger event: an active edge is detected on TRGIN input, or any edge in suspend mode.
Bit 5	Reserved	0x0	resd	Kept at its default value
Bit 4	C4IF	0x0	rw0c	Channel 4 interrupt flag

				Please refer to C1IF description.
Bit 3	C3IF	0x0	rw0c	Channel 3 interrupt flag Please refer to C1IF description.
Bit 2	C2IF	0x0	rw0c	Channel 2 interrupt flag Please refer to C1IF description.
Bit 1	C1IF	0x0	rw0c	Channel 1 interrupt flag If the channel 1 is configured as input mode: This bit is set by hardware on a capture event. It is cleared by software or read access to the TMRx_C1DT 0: No capture event occurs 1: Capture event is generated If the channel 1 is configured as output mode: This bit is set by hardware on a compare event. It is cleared by software. 0: No compare event occurs 1: Compare event is generated
Bit 0	OVFIF	0x0	rw0c	Overflow interrupt flag This bit is set by hardware on an overflow event. It is cleared by software. 0: No overflow event occurs 1: Overflow event is generated. If OVFEN=0 and OVFS=0 in the TMRx_CTRL1 register: − An overflow event is generated when OVFG= 1 in the TMRx_SWEVE register; − An overflow event is generated when the counter CVAL is reinitialized by a trigger event.

14.1.4.6 Software event register (TMRx_SWEVT)

Bit	Register	Reset value	Type	Description
Bit 15: 7	Reserved	0x000	resd	Kept at its default value.
Bit 6	TRGSWTR	0x0	rw	Trigger event triggered by software This bit is set by software to generate a trigger event. 0: No effect 1: Generate a trigger event.
Bit 5	Reserved	0x0	resd	Kept at its default value.
Bit 4	C4SWTR	0x0	wo	Channel 4 event triggered by software Please refer to C1M description.
Bit 3	C3SWTR	0x0	wo	Channel 3 event triggered by software Please refer to C1M description.
Bit 2	C2SWTR	0x0	wo	Channel 2 event triggered by software Please refer to C1M description
Bit 1	C1SWTR	0x0	wo	Channel 1 event triggered by software This bit is set by software to generate a channel 1 event. 0: No effect 1: Generate a channel 1 event.
Bit 0	OVFSWTR	0x0	wo	Overflow event triggered by software This bit is set by software to generate an overflow event. 0: No effect 1: Generate an overflow event.

14.1.4.7 Channel mode register1 (TMRx_CM1)

Output compare mode:

Bit	Register	Reset value	Type	Description
Bit 15	C2OSEN	0x0	rw	Channel 2 output switch enable
Bit 14: 12	C2OCTRL	0x0	rw	Channel 2 output control
Bit 11	C2OBEN	0x0	rw	Channel 2 output buffer enable
Bit 10	C2OIEN	0x0	rw	Channel 2 output enable immediately
Bit 9: 8	C2C	0x0	rw	Channel 2 configuration This field is used to define the direction of the channel 2 (input or output), and the selection of input pin when C2EN='0': 00: Output 01: Input,， C2IN is mapped on C2IFP2 10: Input, C2IN is mapped on C1IFP2 11: Input, C2IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS register.
Bit 7	C1OSEN	0x0	rw	Channel 1 output switch enable 0: C1ORAW is not affected by EXT 1: Once high level is detect on EXT input, clear C1ORAW.
Bit 6: 4	C1OCTRL	0x0	rw	Channel 1 output control This field defines the behavior of the original signal C1ORAW. 000: Disconnected. C1ORAW is disconnected from C1OUT; 001: C1ORAW is high when TMRx_CVAL=TMRx_C1DT 010: C1ORAW is low when TMRx_CVAL=TMRx_C1DT 011: Switch C1ORAW level when TMRx_CVAL=TMRx_C1DT 100: C1ORAW is forced low 101: C1ORAW is forced high. 110: PWM mode A －OWCDIR=0, C1ORAW is high once TMRx_C1DT>TMRx_CVAL, else low; －OWCDIR=1, C1ORAW is low once TMRx_ C1DT <TMRx_CVAL, else high; 111: PWM mode B －OWCDIR=0, C1ORAW is low once TMRx_ C1DT >TMRx_CVAL, else high; －OWCDIR=1, C1ORAW is high once TMRx_ C1DT <TMRx_CVAL, else low. *Note: In the configurations othern than 000', the C1OUT is connected to C1ORAW. The C1OUT output level is not only subject to the changes of C1ORAW, but also the output polarity set by CCTRL.*
Bit 3	C1OBEN	0x0	rw	Channel 1 output buffer enable 0: Buffer function of TMRx_C1DT is disabled. The new value written to the TMRx_C1DT takes effect immediately. 1: Buffer function of TMRx_C1DT is enabled. The value to be written to the TMRx_C1DT is stored in the buffer register, and can be sent to the TMRx_C1DT register only on an overflow event.
Bit 2	C1OIEN	0x0	rw	Channel 1 output enable immediately In PWM mode A or B, this bit is used to accelerate the channel 1 output's response to the trigger event.

				0: Need to compare the CVAL with C1DT before generating an output 1: No need to compare the CVAL and C1DT. An output is generated immediately when a trigger event occurs.
Bit 1: 0	C1C	0x0	rw	Channel 1 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C1EN='0': 00: Output 01: Input, C1IN is mapped on C1IFP1 10: Input, C1IN is mapped on C2IFP1 11: Input, C1IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

Input capture mode:

Bit	Register	Reset value	Type	Description
Bit 15: 12	C2DF	0x0	rw	Channel 2 digital filter
Bit 11: 10	C2IDIV	0x0	rw	Channel 2 input divider
Bit 9: 8	C2C	0x0	rw	Channel 2 configuration This field is used to define the direction of the channel 2 (input or output), and the selection of input pin when C2EN='0': 00: Output 01: Input, C2IN is mapped on C2IFP2 10: Input, C2IN is mapped on C1IFP2 11: Input, C2IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.
Bit 7: 4	C1DF	0x0	rw	Channel 1 digital filter This field defines the digital filter of the channel 1. N stands for the number of filtering, indicating that the input edge can pass the filter only after N sampling events. 0000: No filter, sampling is done at f_{DTS} 1000: $f_{SAMPLING}=f_{DTS}/8$, N=6 0001: $f_{SAMPLING}=f_{CK\_INT}$, N=2 1001: $f_{SAMPLING}=f_{DTS}/8$, N=8 0010: $f_{SAMPLING}=f_{CK\_INT}$, N=4 1010: $f_{SAMPLING}=f_{DTS}/16$, N=5 0011: $f_{SAMPLING}=f_{CK\_INT}$, N=8 1011: $f_{SAMPLING}=f_{DTS}/16$, N=6 0100: $f_{SAMPLING}=f_{DTS}/2$, N=6 1100: $f_{SAMPLING}=f_{DTS}/16$, N=8 0101: $f_{SAMPLING}=f_{DTS}/2$, N=8 1101: $f_{SAMPLING}=f_{DTS}/32$, N=5 0110: $f_{SMPLING}=f_{DTS}/4$, N=6 1110: $f_{SAMPLING}=f_{DTS}/32$, N=6 0111: $f_{SAMPLING}=f_{DTS}/4$, N=8 1111: $f_{SAMPLING}=f_{DTS}/32$, N=8
Bit 3: 2	C1IDIV	0x0	rw	Channel 1 input divider This field defines Channel 1 input divider. 00: No divider. An input capture is generated at each active edge. 01: An input compare is generated every 2 active edges 10: An input compare is generated every 4 active edges 11: An input compare is generated every 8 active edges Note: the divider is reset once C1EN='0'

Bit 1: 0	C1C	0x0	rw	Channel 1 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C1EN='0': 00: Output 01: Input, C1IN is mapped on C1IFP1 10: Input, C1IN is mapped on C2IFP1 11: Input, C1IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

14.1.4.8 Channel mode register2 (TMRx_CM2)

Output compare mode:

Bit	Register	Reset value	Type	Description
Bit 15	C4OSEN	0x0	rw	Channel 4 output switch enable
Bit 14: 12	C4OCTRL	0x0	rw	Channel 4 output control
Bit 11	C4OBEN	0x0	rw	Channel 4 output buffer enable
Bit 10	C4OIEN	0x0	rw	Channel 4 output enable immediately
Bit 9: 8	C4C	0x0	rw	Channel 4 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C4EN='0': 00: Output 01: Input, C4IN is mapped on C4IFP4 10: Input, C4IN is mapped on C3IFP4 11: Input, C4IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.
Bit 7	C3OSEN	0x0	rw	Channel 3 output switch enable
Bit 6: 4	C3OCTRL	0x0	rw	Channel 3 output control
Bit 3	C3OBEN	0x0	rw	Channel 3 output buffer enable
Bit 2	C3OIEN	0x0	rw	Channel 3 output enable immediately
Bit 1: 0	C3C	0x0	rw	Channel 3 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C3EN='0': 00: Output 01: Input, C3IN is mapped on C3IFP3 10: Input, C3IN is mapped on C4IFP3 11: Input, C3IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

Input capture mode:

Bit	Register	Reset value	Type	Description
Bit 15: 12	C4DF	0x0	rw	Channel 4 digital filter
Bit 11: 10	C4IDIV	0x0	rw	Channel 4 input divider
Bit 9: 8	C4C	0x0	rw	Channel 4 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C4EN='0': 00: Output 01: Input, C4IN is mapped on C4IFP4 10: Input, C4IN is mapped on C3IFP4 11: Input, C4IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.
Bit 7: 4	C3DF	0x0	rw	Channel 3 digital filter
Bit 3: 2	C3IDIV	0x0	rw	Channel 3 input divider
Bit 1:0	C3C	0x0	rw	Channel 3 configuration

	This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C3EN='0': 00: Output 01: Input, C3IN is mapped on C3IFP3 10: Input, C3IN is mapped on C4IFP3 11: Input, C3IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

14.1.4.9 Channel control register (TMRx_CCTRL)

Bit	Register	Reset value	Type	Description
Bit 15: 14	Reserved	0x0	resd	Kept at its default value.
Bit 13	C4P	0x0	rw	Channel 4 polarity Pleaser refer to C1P description.
Bit 12	C4EN	0x0	rw	Channel 4 enable Pleaser refer to C1EN description.
Bit 11: 10	Reserved	0x0	resd	Default value
Bit 9	C3P	0x0	rw	Channel 3 polarity Pleaser refer to C1P description.
Bit 8	C3EN	0x0	rw	Channel 3 enable Pleaser refer to C1EN description.
Bit 7: 6	Reserved	0x0	resd	Kept at its default value.
Bit 5	C2P	0x0	rw	Channel 2 polarity Pleaser refer to C1P description.
Bit 4	C2EN	0x0	rw	Channel 2 enable Pleaser refer to C1EN description.
Bit 3: 2	Reserved	0x0	resd	Kept at its default value.
Bit 1	C1P	0x0	rw	Channel 1 polarity When the channel 1 is configured as output mode: 0: C1OUT is active high 1: C1OUT is active low When the channel 1 is configured as input mode: 0: C1IN active edge is on its rising edge. When used as external trigger, C1IN is not inverted. 1: C1IN active edge is on its falling edge. When used as external trigger, C1IN is inverted.
Bit0	C1EN	0x0	rw	Channel 1 enable 0: Input or output is disabled 1: Input or output is enabled

Table 14-5 Standard CxOUT channel output control bit

CxEN bit	CxOUT output state
0	Output disabled (CxOUT=0, Cx_EN=0)
1	CxOUT = CxORAW + polarity, Cx_EN=1

Note: The state of the external I/O pins connected to the standard CxOUT channel depends on the CxOUT channel state and the GPIO and IOMUX registers.

14.1.4.10 Counter value (TMRx_CVAL)

Bit	Register	Reset value	Type	Description
Bit 31: 16	CVAL	0x0000	rw	Counter value When TMR2 or TMR5 enables plus mode (the PMEN bit in the TMR_CTRL1 register), the CVAL is expanded to 32 bits.
Bit 15: 0	CVAL	0x0000	rw	Counter value

14.1.4.11 Division value (TMRx_DIV)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DIV	0x0000	rw	Divider value The counter clock frequency $f_{CK\_CNT} = f_{TMR\_CLK}$ /(DIV[15: 0]+1). DIV contains the value written at an overflow event.

14.1.4.12 Period register (TMRx_PR)

Bit	Register	Reset value	Type	Description
Bit 31: 16	PR	0x0000	rw	Period value When TMR2 or TMR5 enables plus mode (the PMEN bit in the TMR_CTRL1 register), the PR is expanded to 32 bits.
Bit 15: 0	PR	0x0000	rw	Period value This defines the period value of the TMRx counter. The timer stops working when the period value is 0.

14.1.4.13 Channel 1 data register (TMRx_C1DT)

Bit	Register	Reset value	Type	Description
Bit 31: 16	C1DT	0x0000	rw	Channel 1 data register When TMR2 or TMR5 enables plus mode (the PMEN bit in the TMR_CTRL1 register), the C1DT is expanded to 32 bits.
Bit 15: 0	C1DT	0x0000	rw	Channel 1 data register When the channel 1 is configured as input mode: The C1DT is the CVAL value stored by the last channel 1 input event (C1IN) When the channel 1 is configured as output mode: C1DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C1OBEN bit, and the corresponding output is generated on C1OUT as configured.

14.1.4.14 Channel 2 data register (TMRx_C2DT)

Bit	Register	Reset value	Type	Description
Bit 31: 16	C2DT	0x0000	rw	Channel 2 data register When TMR2 or TMR5 enables plus mode (the PMEN bit in the TMR_CTRL1 register), the C2DT is expanded to 32 bits.
Bit 15: 0	C2DT	0x0000	rw	Channel 2 data register When the channel 2 is configured as input mode: The C2DT is the CVAL value stored by the last channel 2 input event (C1IN) When the channel 2 is configured as output mode: C2DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C2OBEN bit, and the corresponding output is generated on C2OUT as configured.

14.1.4.15 Channel 3 data register (TMRx_C3DT)

Bit	Register	Reset value	Type	Description
Bit 31: 16	C3DT	0x0000	rw	Channel 3 data register When TMR2 or TMR5 enables plus mode (the PMEN bit in the TMR_CTRL1 register), the C3DT is expanded to 32 bits.
Bit 15: 0	C3DT	0x0000	rw	Channel 3 data register When the channel 3 is configured as input mode: The C3DT is the CVAL value stored by the last channel 3 input event (C1IN) When the channel 3 is configured as output mode: C3DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C3OBEN bit, and the corresponding output is generated on C3OUT as configured.

14.1.4.16 Channel 4 data register (TMRx_C4DT)

Bit	Register	Reset value	Type	Description
Bit 31: 16	C4DT	0x0000	rw	Channel 4 data register When TMR2 or TMR5 enables plus mode (the PMEN bit in the TMR_CTRL1 register), the C4DT is expanded to 32 bits.
Bit 15: 0	C4DT	0x0000	rw	Channel 4 data register When the channel 4 is configured as input mode: The C4DT is the CVAL value stored by the last channel 4 input event (C1IN) When the channel 4 is configured as output mode: C4DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C4OBEN bit, and the corresponding output is generated on C4OUT as configured.

14.1.4.17 DMA control register (TMRx_DMACTRL)

Bit	Register	Reset value	Type	Description
Bit 15: 13	Reserved	0x0	resd	Kept at its default value.
Bit 12: 8	DTB	0x00	rw	DMA transfer bytes This field defines the number of DMA transfers: 00000: 1 byte 00001: 2 bytes 00010: 3 bytes 00011: 4 bytes .... 10000: 17 bytes 10001: 18 bytes
Bit 7: 5	Reserved	0x0	resd	Kept at its default value.
Bit 4: 0	ADDR	0x00	rw	DMA transfer address offset ADDR is defined as an offset starting from the address of the TMRx_CTRL1 register. 00000: TMRx_CTRL1， 00001: TMRx_CTRL2， 00010: TMRx_STCTRL， .....

14.1.4.18 DMA data register (TMRx_DMADT)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DMADT	0x0000	rw	DMA data register A read or write operation to the DMADT register accesses the TMR registers at the following address: TMRx peripheral address + ADDR*4 to TMRx peripheral address + ADDR*4 + DTB*4.

14.2 General-purpose timer (TMR9 to TMR11)

14.2.1 TMRx introduction

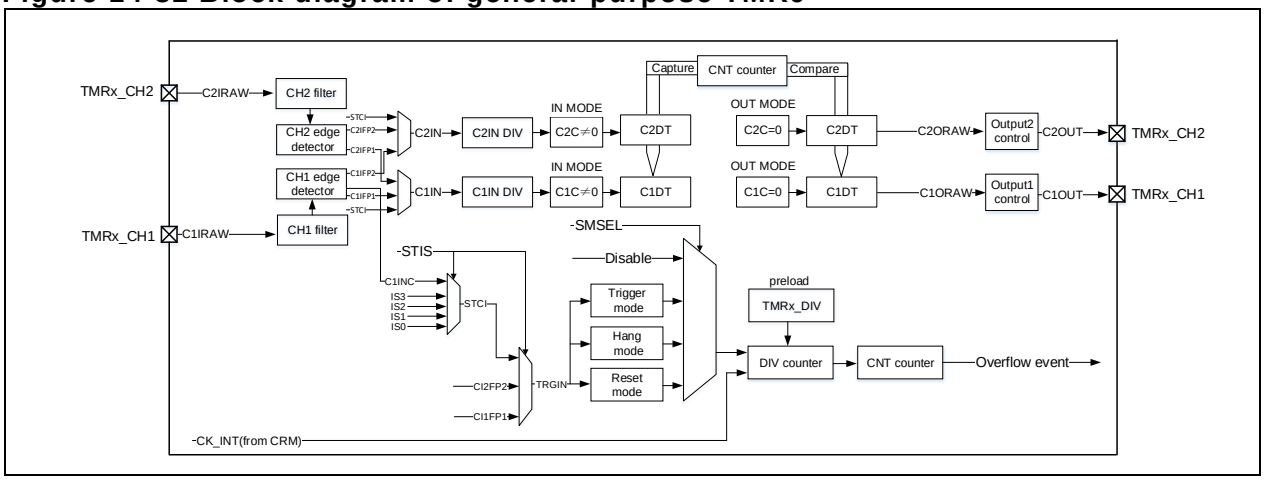
The general-purpose timer (TMR9 to TMR11) consists of a 16-bit counter supporting upcounting mode. These timers can be synchronized.

14.2.2 TMRx main features

14.2.2.1 TMR9 main features

- Souce of counter clock: internal clock and external clock
- 16-bit up counter
- 2 independent channels for input capture, output compare, PWM generation and one-pulse mode output
- Synchronization control between master and slave timers
- Interrrupt is generated at overflow event, trigger event and channel event

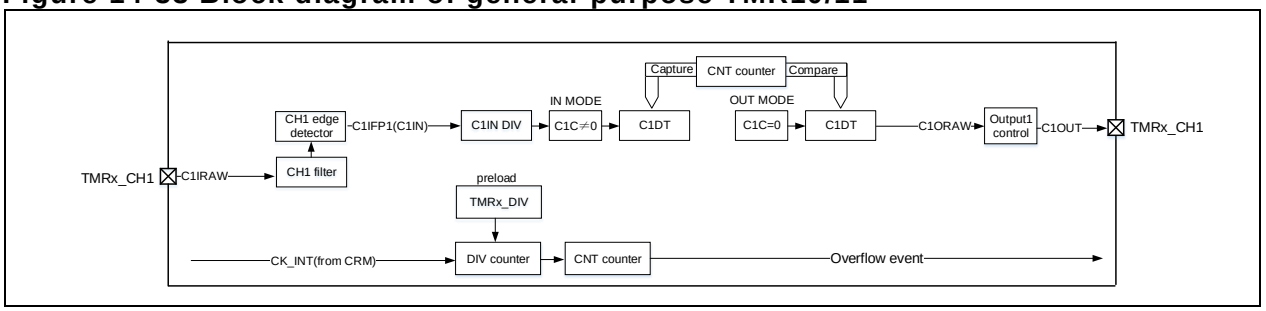
Figure 14-32 Block diagram of general-purpose TMR9



14.2.2.2 TMR10 and TMR11 main features

- Souce of counter clock: internal clock
- 16-bit up counter
- 1 independent channel for input capture, output compare, PWM generation
- Synchronization control between master and slave timers
- Interrrupt is generated at overflow event and channel event

Figure 14-33 Block diagram of general-purpose TMR10/11

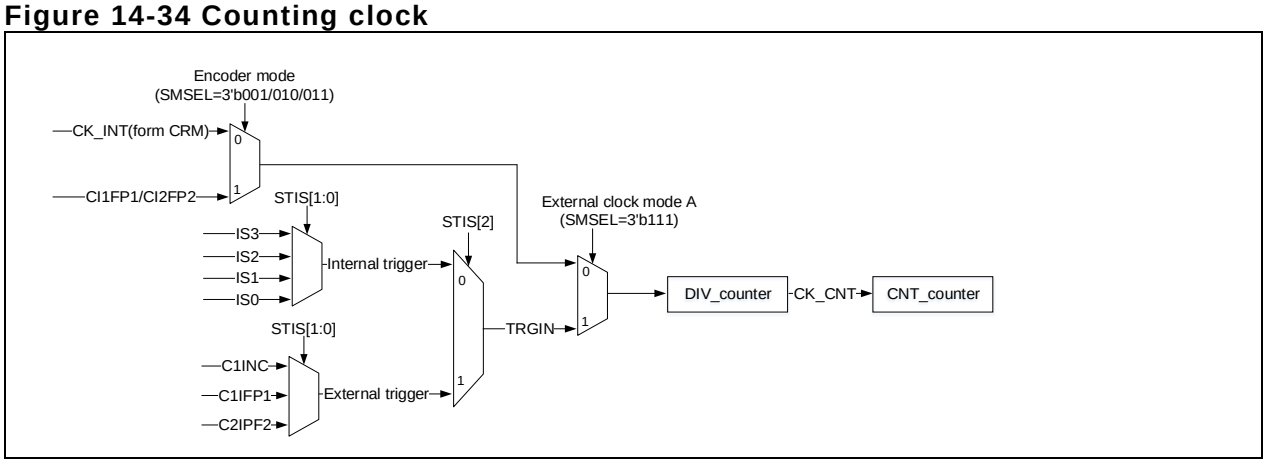


14.2.3 TMRx functional overview

14.2.3.1 Counting clock

The count clock of general-purpose timers can be provided by the internal clock (CK_INT), external clock (external clock mode A) and internal trigger input (ISx)

Figure 14-34 Counting clock



Internal clock (CK_INT)

By default, the CK_INT divided by the prescaler is used to drive the counter to start counting. When TMR's APB clock prescaler factor is 1, the CK_INT frequency is equal to that of APB, otherwise, it doubles the APB clock frequency.

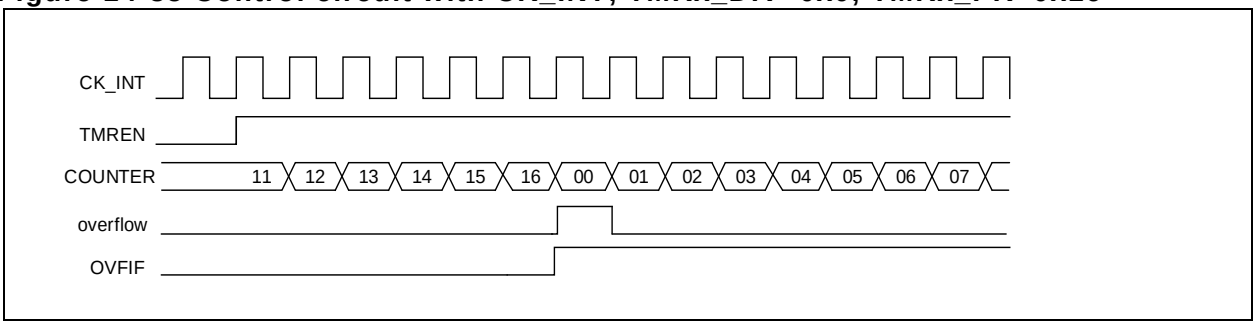
Configuration procedures:

- Set CK_INT frequency by setting the CLKDIV[1:0] in TMRx_CTRL1 register
- Set counting frequency through TMRx_DIV register

-Set counting cycles through TMRx_PR register

- Eanble a counter by setting the TMREN bit in the TMRx_CTRL1 register

Figure 14-35 Control circuit with CK_INT, TMRx_DIV=0x0, TMRx_PR=0x16



External clock (TMR9 only)

The counter clock can be provided by TRGIN signal.

SMSEL=3'b111: External clock mode A is selected. Select an external clock source TRGIN signal by setting the STIS[2: 0] bit to drive the counter to start counting.

The external clock sources include: C1INC (STIS=3'b100, channel 1 rising edge and falling edge), C1IFP1 (STIS=3'b101, the channel 1 signal with filtering and polarity selection) and C2IFP2

(STIS=3’b110, a channel 2 signal with filtering and polarity selection).

To use external clock mode A, follow the steps below:

-Set external source TRGIN parameters

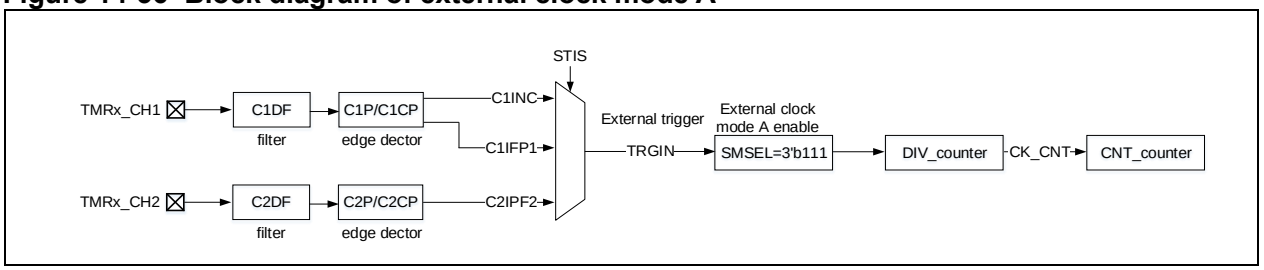
If the TMRx_CH1 is used as a source of TRGIN, it is necessary to configure channel 1 input filter (C1DF[3:0] in TMRx_CM1 register) and channel 1 input polarity (C1P/C1CP in TMRx_CCTRL register);

If the TMRx_CH2 is used as source of TRGIN, it is necessary to configure channel 1 input filter (C2DF[3:0] in TMRx_CM1 register) and channel 2 input polarity (C2P/C2CP in TMRx_CCTR register);

- Set TRGIN signal source using the STIS[1:0] bit in TMRx_STCTRL register
- Enable external clock mode A by setting SMSEL=3’b111 in TMRx_STCTR register
- Set counting frequency through the DIV[15:0] in TMRx_DIV register
- Set counting period through the PR[15:0] in TMRx_PR register

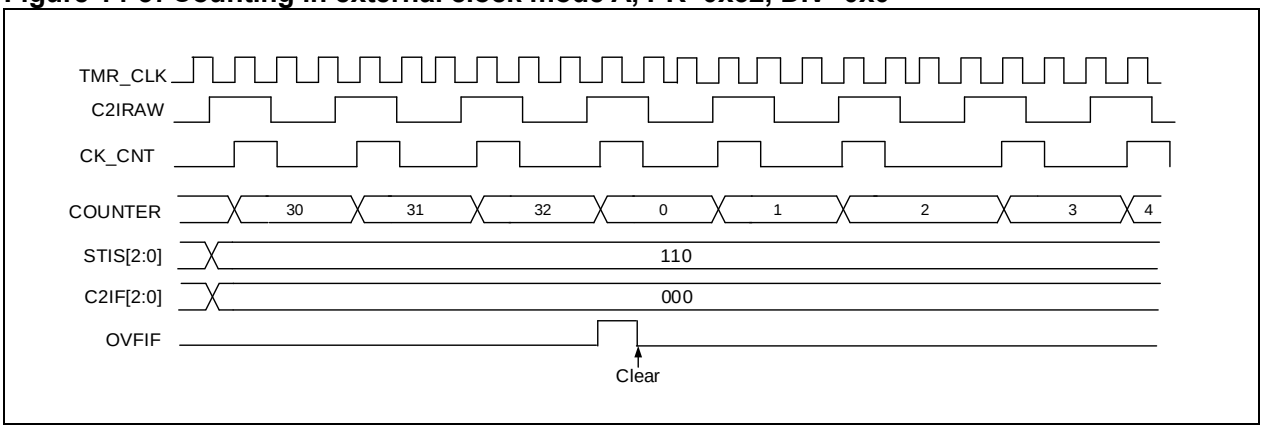
-Enable counter through the TMREN bit in TMRx_CTRL1 register

Figure 14-36 Block diagram of external clock mode A



Note: The delay between the signal on the input side and the actual clock of the counter is due to the synchronization circuit.

Figure 14-37 Counting in external clock mode A, PR=0x32, DIV=0x0



Internal trigger input (ISx)

Timer synchronization allows interconnection between several timers. The TMR_CLK of one timer can be provided by the TRGOUT signal output by another timer. Set the STIS[2: 0] bit to select internal trigger signal to enable counting.

Each timer consists of a 16-bit prescaler, which is used to generate the CK_CNT that enables the counter to count. The frequency division relationship between the CK_CNT and TMR_CLK can be adjusted by setting the value of the TMRx_DIV register. The prescaler value can be modified at any time, but it takes effect only when the next overflow event occurs.

Below is the configuration procedure for interal trigger input:

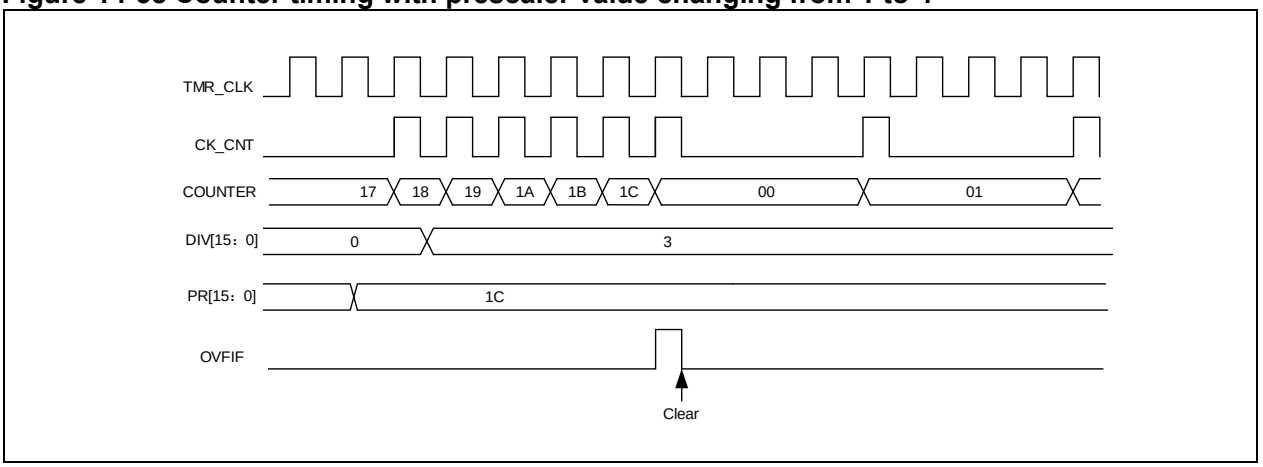
- Set counting cycles through TMRx_PR register
- Set counting frequency through TMRx_DIV register
- Select internal trigger by setting STIS[2:0]= 3’b000~3’b011 in TMRx_STCTRL register
- Select external clock mode A by setting SMSEL[2:0]=3’b111 in TMRx_STCTRL register
- Eable TMRx to start counting through the TMREN in TMRx_CTRL1 register

Table 14-6 TMRx internal trigger connection

Slave controler	IS0 (STIS=000)	IS1 (STIS = 001)	IS2 (STIS = 010)	IS3 (STIS = 011)
TMR9	TMR2	TMR3	TMR10_OC	TMR11_OC

Note: If there is no corresponding timer in a device, the corresponding trigger signal ISx is not present.

Figure 14-38 Counter timing with prescaler value changing from 1 to 4



14.2.3.2 Counting mode

The general-purpose timer (TMR9~TMR11) consists of a 16-bit counter supporting upcounting mode only.

The TMRx_PR register is used to define counting period of counter. The value in the TMRx_PR is immediately moved to the shadow register by deault. When the periodic buffer is enabled (PRBEN=1), the value in the TMRx_PR register is transferred to the shadow register only at an overflow event.

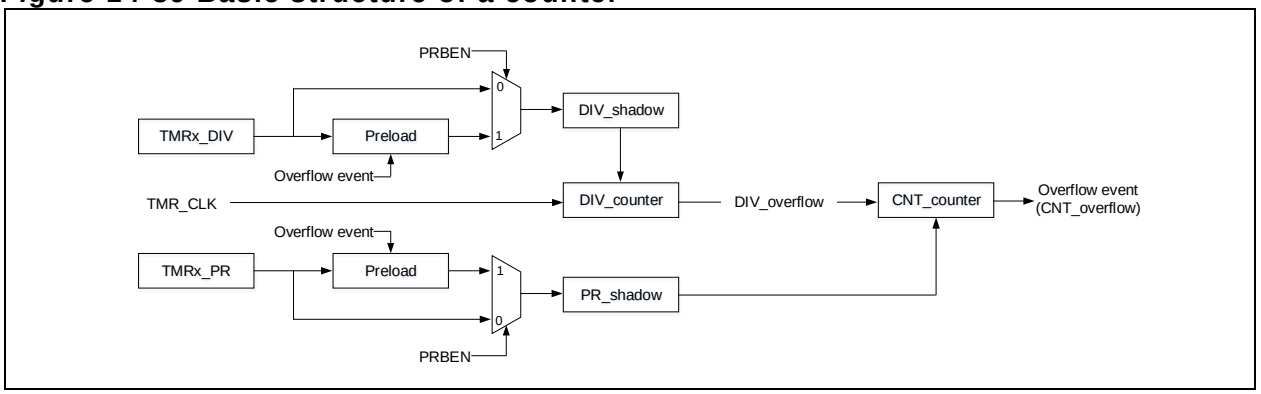
TMRx_DIV register is used to define the counter frequency of the counter. The counter counts once every DIV[15:0]+1 clock cycle. Similar to TMRx_PR register, after enabling periodic buffer, the value of the TMRx_DIV register are transferred into the shadow register at each overflow event.

Reading the TMRx_CNT register returns the current counter value. Writing the TMRx_CNT register will update the current counter value.

An overflow event is is enabled by default. It can be disabled by setting OVFEN=1 in the TMRx_CTRL1 register. The OVFS bit in the TMRx_CTRL1 register is used to select the source of an overflow event, which is, by default, counter overflow or underflow, setting OVFSWTR, reset signal generated by slave mode timer controller in reset mode. Once the OVFS is set, an overflow event is generated only when overflow or underflow occurs.

Settng the TMREN bit (TMREN=1) enables the timer to start counting. Base on synchronization logic, however, the actual enable signal TMR_EN is set 1 clock cycle after the TMREN is set

Figure 14-39 Basic structure of a counter



Upcounting mode

This mode is enabled by setting CMSEL[1:0]=2'b00 and OWCDIR=1'b in the TMRx_CTRL register.

In upcounting mode, the counter counts from 0 to the value programmed in the TMRx_PR register, then restarts from 0, and generates a counter overflow event, with setting OVFIF=1. If the overflow event is disabled, the counter is no longer reloaded with the prescaler value and period value at a counter overflow event, otherwise, the counter is updated with the prescaler value and period value on an overflow event.

Figure 14-40 Overflow event when PRBEN=0

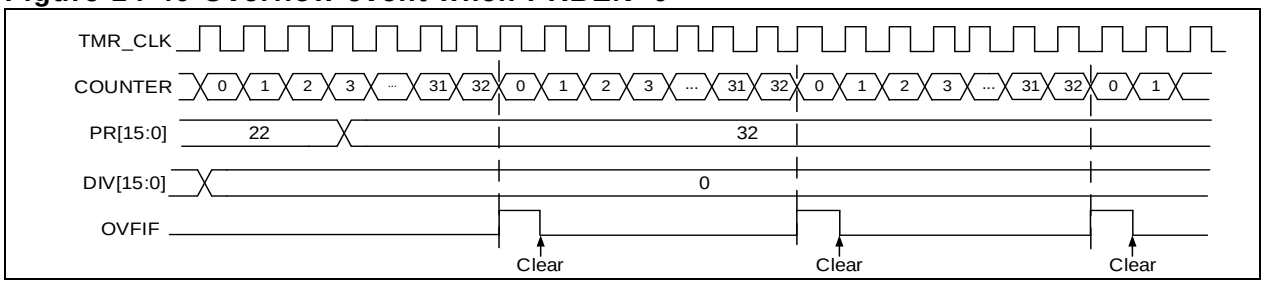


Figure 14-41 Overflow event when PRBEN=1

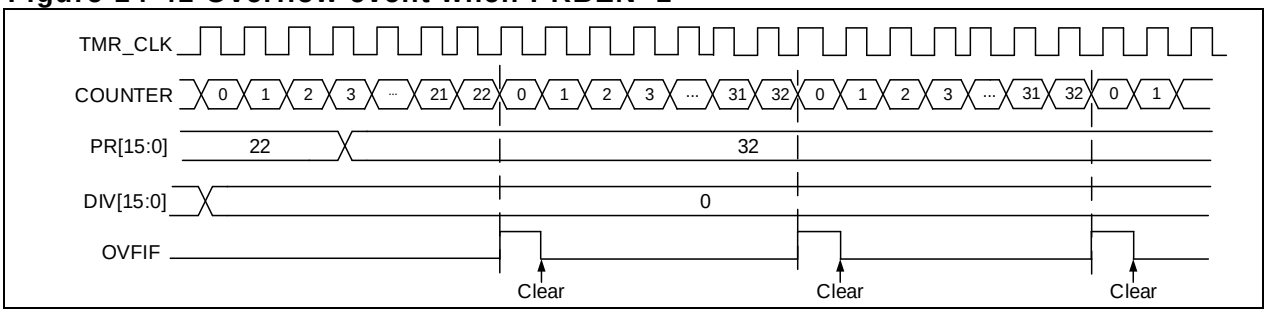

14.2.3.3 TMR input function

TMR9 timer has two independent channels, while each of TMR10 and TMR11 has an independent channel. Each channel can be configured as input or output. As input, each channel input is processed as follows:

1. TMRx_CHx outputs CxIRAW after being preprocessed. Select the TMRx_CHx for CxIRAW through the C1INSEL bit
2. CxIRAW inputs digital filter and outputs filtered CxIF signal. The digital filter uses the CxDF bit to program sampling frequency and sampling times.
3. CxIF inputs edge detector, and outputs the CxIFPx signal after edge selection. The edge selection depends on both CxP and CxCP bits. It is possible to select input rising edge, falling edge or both edges.
4. CxIFPx inputs capture signal selector, and outputs the CxIN signal after capture sigal selection. The capture signal selection is defined by CxC bits. It is possible to select CxIFPx, CyIFPx or STCI as CxIN source. Of those, CyIFPx (x≠y) is the CyIFPy signal that is from Y channel and processed by channel-x edge detector (For example, the C1IFP2 is the Channle 1's C1IFP1 signal that passed through channel 2 edge detection). The STCI comes from slave timer controller, and its source is selected by STIS bit. For a single channel TMR, only CxIFPx can be selected as the source of CxIN.
5. CxIN outputs the CxIPS signal that is divided by input channel divider. The divider factor can be defined as No division, /2, /4 or /8, by the CxIDIV bit. It can be used for filtering, selection, division and input capture of input signals.

Figure 14-42 Input/output channel 1 main circuit

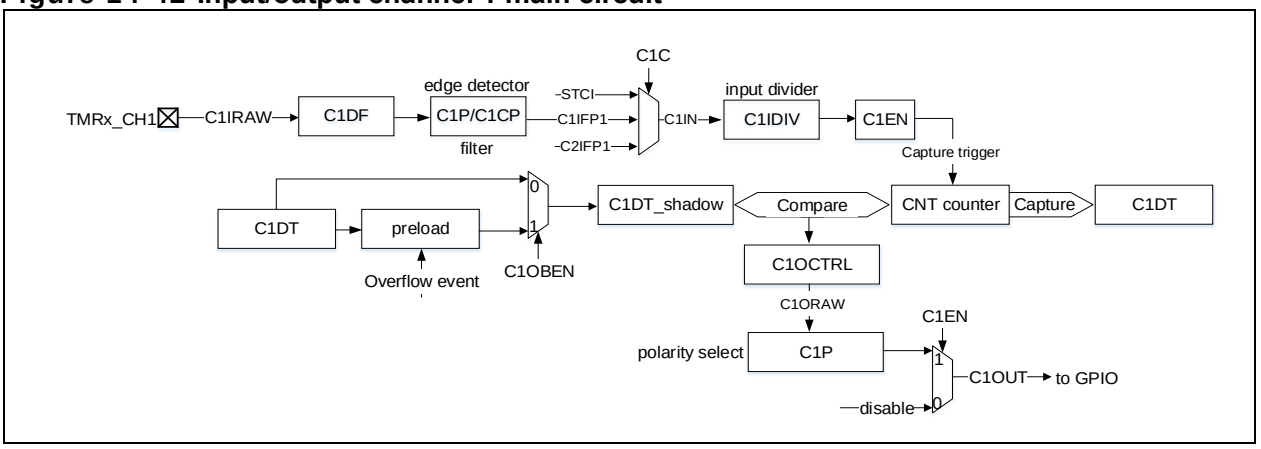

Figure 14-43 Channel 1 input stage

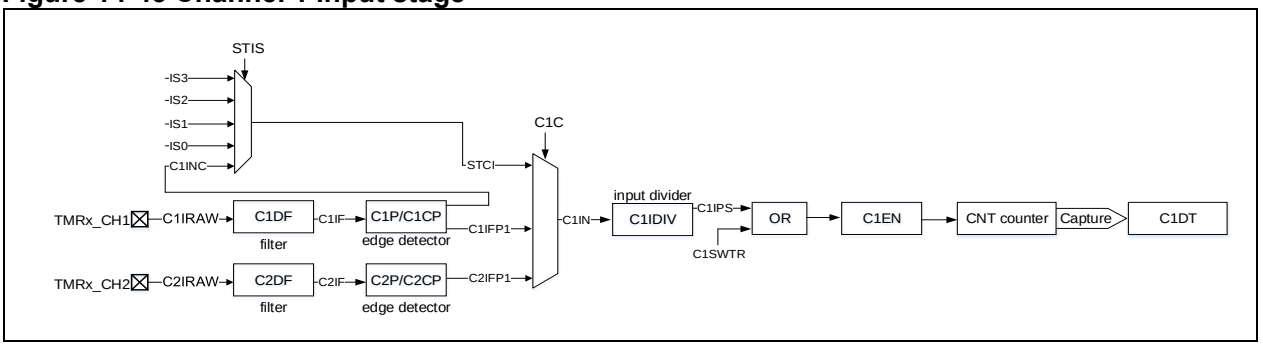

Input mode

In input mode, the TMRx_CxDT registers latch the current counter values after the selected triggle signal is detected, and the capture compare interrupt flag bit (CxIF) is set. An interrupt will be generated if the CxIEN bit is enabled. If the selected trigger signal is detected when the CxIF is set, the CxRF is set.

To capture the rising edge of C1IN input, following the configuration procedure mentioned below:

- Set C1C=01 in the TMRx_CM1 register to select the C1IN as channel 1 input
- Set the filter bandwidth of C1IN signal (CxDF[3: 0])
- Set the active edge on the C1IN channel by writing C1P=0 (rising edge) in the TMRx_CCTR register
- Program the capture frequency of C1IN signal (C1DIV[1: 0])
- Enable channel 1 input capture (C1EN=1)
- If needed, enable the relevant interrupt by setting the C1IEN bit in the TMRx_IDEN register

PWM input (TMR9 only)

PWM input mode is applied to channel 1 and 2. To use this mode, both C1IN and C2IN are mapped on the same TMRx_CHx, and the CxIFPx of either channel 1 or channel 2 must be configured as trigger input and slave mode controller is configured in reset mode.

The PWM input mode can be used to measure the period and duty cycle of the PWM input signal. For example, the user can measure the period and duty cycle of the PWM applied on channel 1 using the following procedures:

- Set C1C=2'b01: select C1IN for C1IFP1
- Set C1P=1'b0, select C1IFP1 rising edge active
- Set C2C=2'b10, select C2IN for C1IFP2
- Set C2P=1'b1, select C1IFP2 falling edge active
- Set STIS=3'b101, select the slave mode timer trigger singal as C1IFP1
- Set SMSEL=3'b100: configure the slave mode controller in reset mode
- Set C1EN=1'b1 and C2EN=1'b1. Enable channel 1 and input capture

After above configuration, the rising edge of channel 1 input signal will trigger the capture and stores the capture value into C1DT register, and it will reset the counter at the same time. The falling edge of the channel 1 input signal triggers the capture and stores the capture value into C2DT register. The period of the channel 1 input signal is calculated through C1DT, and its duty cycle through C2DT.

Figure 14-44 PWM input mode configuration example

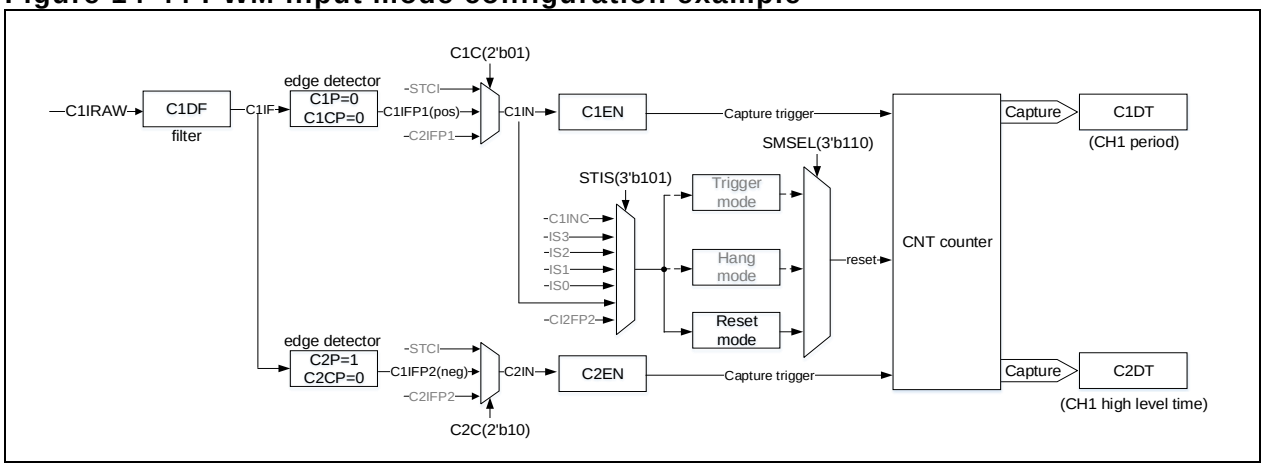

Figure 14-45 PWM input mode

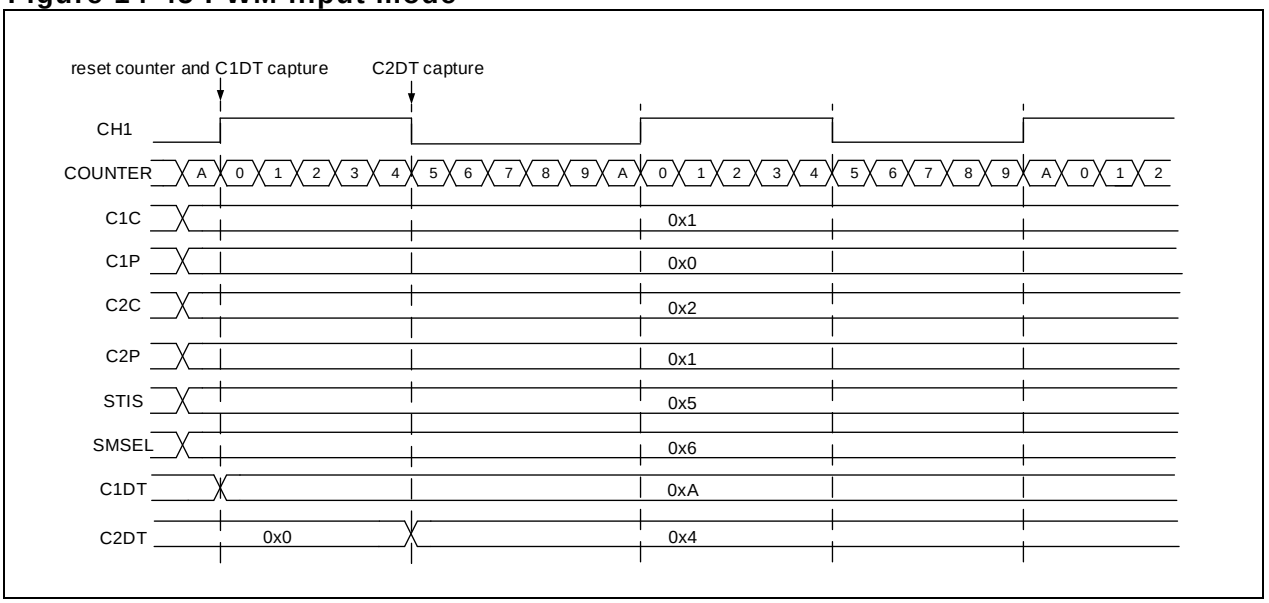
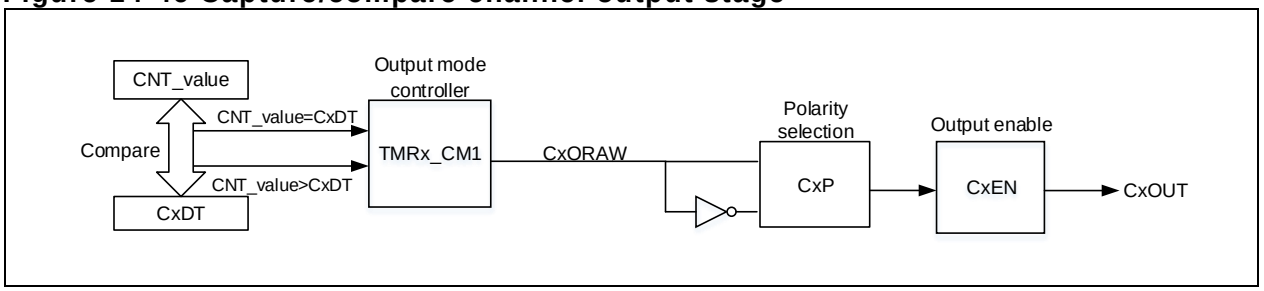


14.2.3.4 TMR output function

The TMR output consists of a comparator and an output controller. It is used to program the period, duty cycle and polarity of the output signal.

Figure 14-46 Capture/compare channel output stage



Output mode

Write CxC[1: 0]≠2'b00 to configure the channel as output to implement multiple output modes. In this case, the counter value is compared with the value in the TMRx_CxDT register, and the intermediate signal CxORAW is generated according to the output mode selected by CxOCTRL[2: 0], which is sent to IO after being processed by the output control circuit. The period of the output signal is configured by the TMRx_PR register, while the duty cycle by the TMRx_CxDT register.

Output compare modes include:

PWM mode A:

Enable PWM mode A by setting CxOCTRL=3'b110. In upcounting mode, C1ORAW outputs high

when TMRx_C1DT>TMRx_CVAL, otherwise, it is low; In downcounting mode, C1ORAW outputs low when TMRx_C1DT<TMRx_CVAL, otherwise, it is high.
To use PWM mode A, the following procedures are recommended:

- Set PWM periods through TMRx_PR register
- Set PWM duty cycles through TMRx_CxD
- Select PWM mode A by setting CxOCTRL=3'b110 in the TMRx_CM1/CM2 register
- Set counting frequency through TMRx_DIV register
- Select counting mode by setting the TWCMSEL[1:0] bit in the TMRx_CTRL1 register
- Select output polarity through the CxP and CxCP bits in the TMRx_CCTRL register
- Enable channel output through the CxEN and CxCEN bits in the TMRx_CCTRL register
- Enable TMRx output through the OEN bit in the TMRx_BRK register
- Configure GPIOs corresponding to TMR output channels as multiplexed mode
- Enable TMRx to start counting through the TMREN bit in the TMRx_CTRL1 register.

PWM mode B:
Enable PWM mode B by setting CxOCTRL=3'b111. In upcounting mode, C1ORAW outputs low when TMRx_C1DT>TMRx_CVAL, otherwise, it is high; In downcounting mode, C1ORAW outputs high when TMRx_C1DT<TMRx_CVAL, otherwise, it is low.
Forced output mode:
Enable forced output mode by setting CxOCTRL=3'b100/101. In this case, the CxORAW is forced to be the programmed level, regardless of the counter value. Despite this, the channel flag bit and DMA request still depend on the compare result.
Output compare mode:
Enable output compare mode by setting CxOCTRL=3'b001/010/011. In this case, when the counter value matches the value of the CxDT register, the CxORAW is forced high (CxOCTRL=3'b001), low (CxOCTRL=3'b010) or toggling (CxOCTRL=3'b011).
One-pulse mode (TMR9 only):
This is a particular case of PWM mode. Enable one-pulse by setting OCMEN=1. In this mode, the comparison match is performed in the current counting period. The TMREN bit is cleared as soon as the current counting is completed. Therefore, only one pulse is output. When in upcounting mode, the configureation must follow the rule: CVAL<CxDT≤PR; in downcounting mode, CVAL>CxDT is required.
Fast output mode (TMR9 only):
Enable this mode by setting CxOIEN=1. If enabled, the CxORAW signal will not change when the counter value matches the CxDT, but change at the beginning of the current counting period. In other words, the comparison result is advanced, so the comparison result between the counter value and the TMRx_CxDT register will determine the level of CxORAW in advance.
Figure 14-47 gives an example of output compare mode (toggle) with C1DT=0x3. When the counter value is equal to 0x3, C1OUT toggles.
Figure 14-48 gives an example of the combination between upcounting mode and PWM mode A. The output signal behaves when PR=0x32 but CxDT is configured with a different value.
Figure 14-49 gives an example of the combination between upcounting mode and one-pulse PWM mode B. The counter only counts only one cycle, and the output signal sents only one pulse.

Figure 14-47 C1ORAW toggles when counter value matches the C1DT value

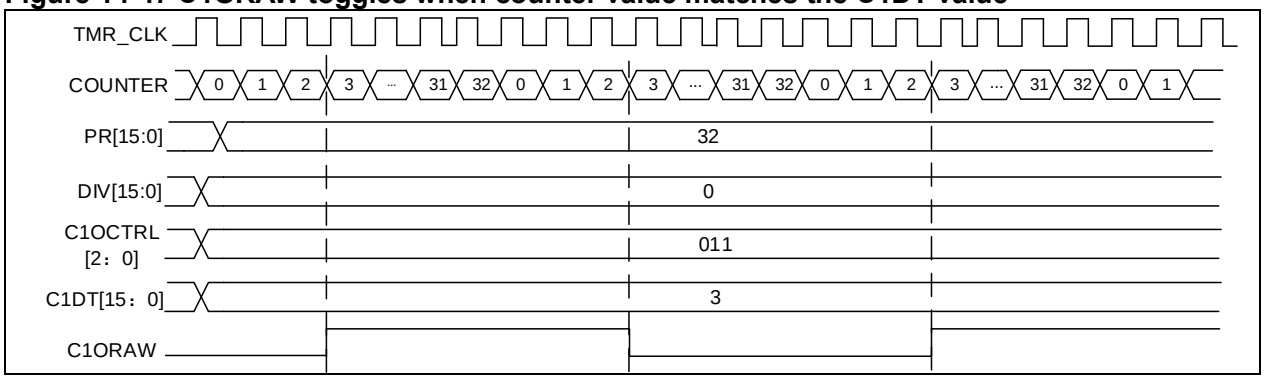


Figure 14-48 Upcounting mode and PWM mode A

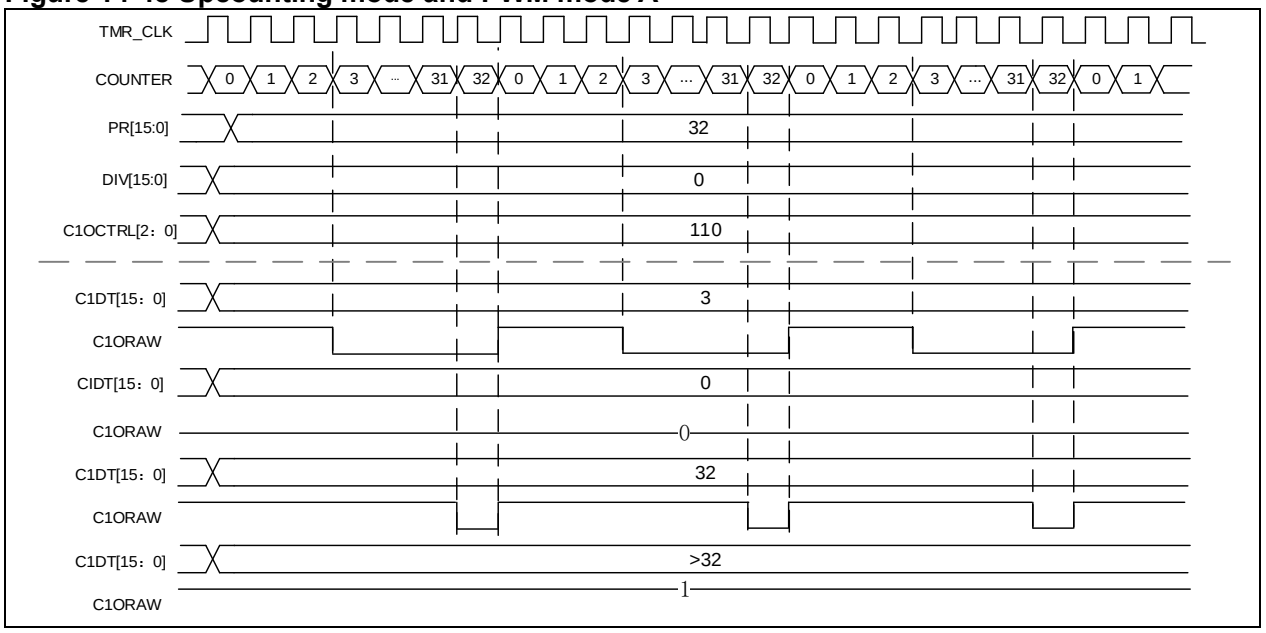

Figure 14-49 One-pulse mode

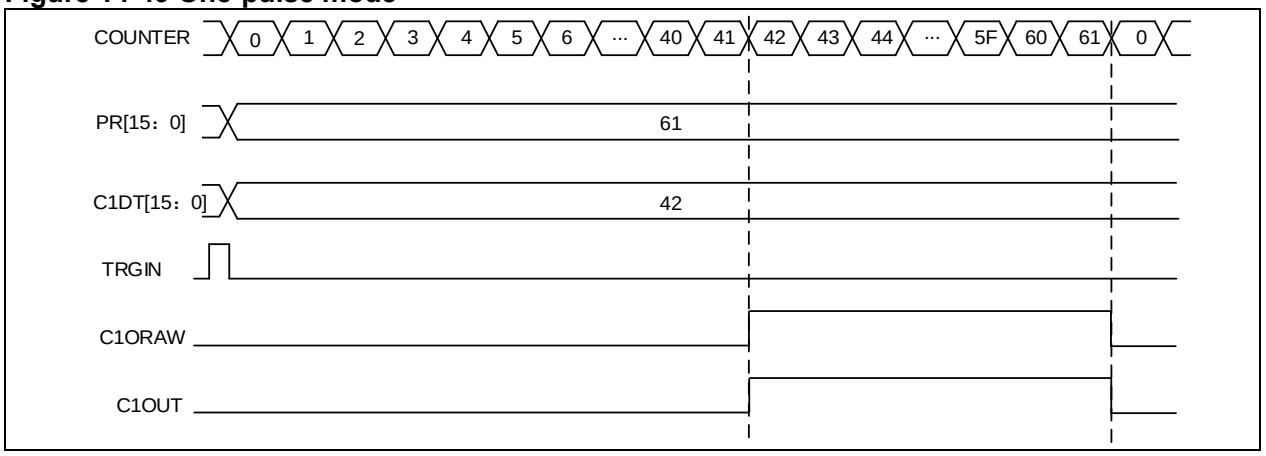


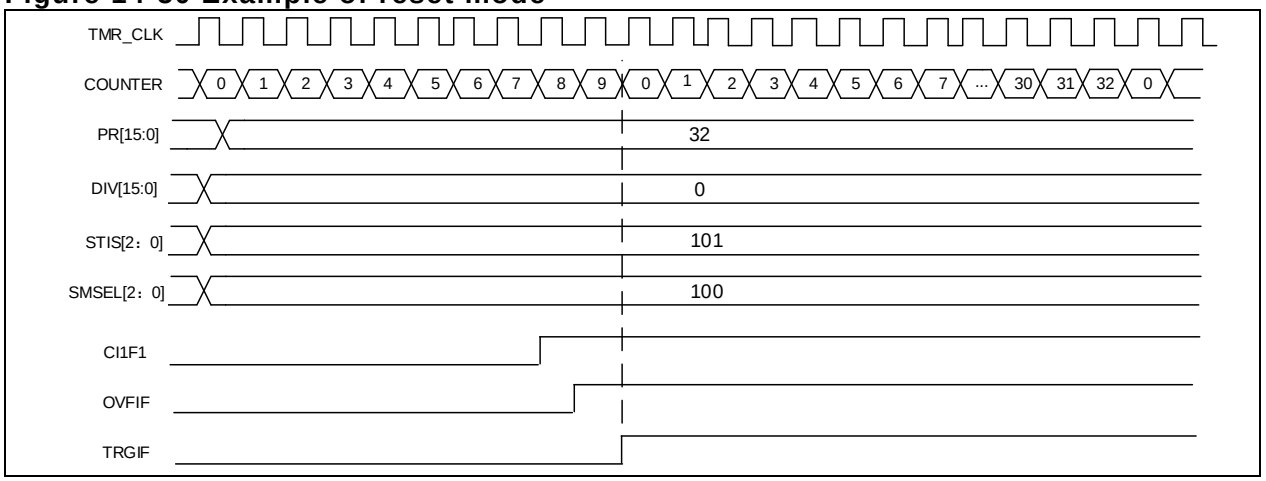
14.2.3.5 TMR synchronization

TMR9 can be used as a slave timer and synchronized with the main timer via an internal signal. Slave timer is selected by setting the SMSEL[2: 0] bit.

Slave mode: Reset mode

The counter and its prescaler can be reset by a selected trigger signal. An overflow event is generated when OVFS=0.

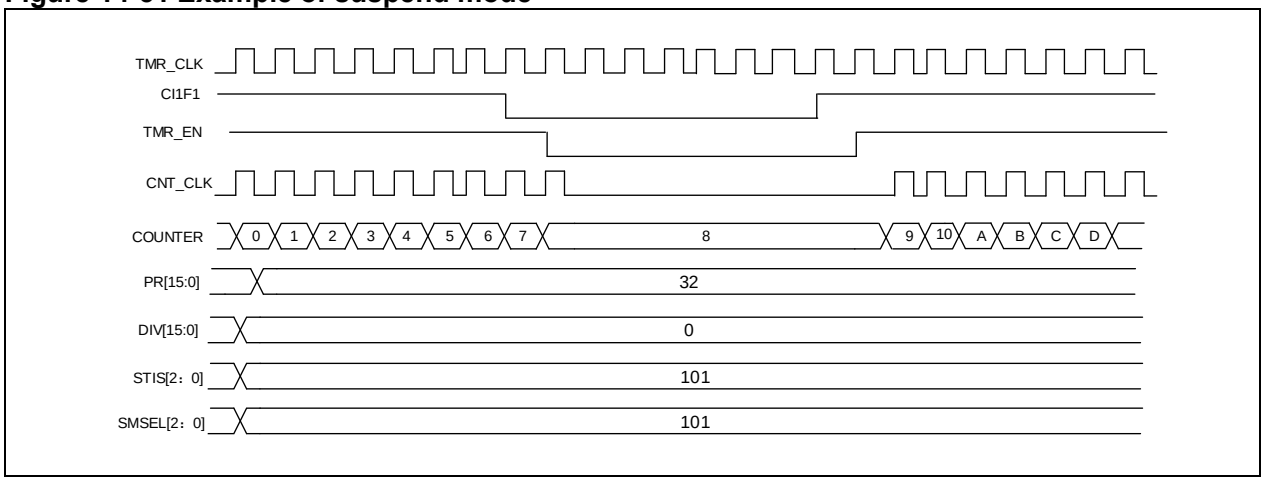
Figure 14-50 Example of reset mode



Slave mode: Suspend mode

In this mode, the counter is controlled by a selected trigger input. The counter starts counting when the trigger input is high and stops as soon as the trigger input is low.

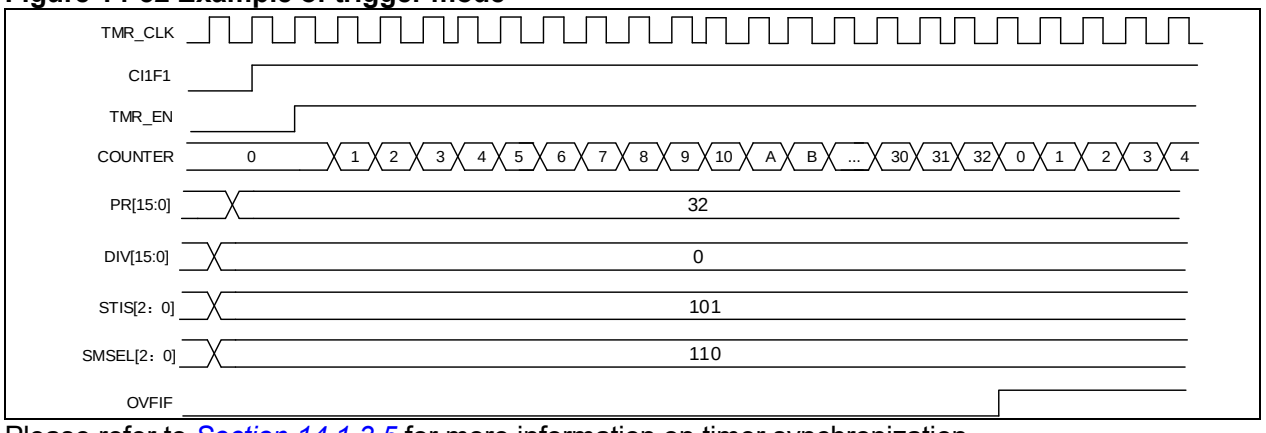
Figure 14-51 Example of suspend mode



Slave mode: Trigger mode

The counter can start counting on the rising edge of a selected trigger input (TMR_EN=1)

Figure 14-52 Example of trigger mode



Please refer to *Section 14.1.3.5* for more information on timer synchronization.

14.2.3.6 Debug mode

When the microcontroller enters debug mode (Cortex®-M4F core halted), the TMRx counter stops counting by setting the TMRx_PAUSE in the DEBUG module.

14.2.4 TMR9 registers

These peripheral registers must be accessed by word (32 bits).

All TMRx register are mapped into a 16-bit addressable space.

Table 14-7 TMRx register map and reset value

Bit	Register	Reset value
TMR9_CTRL1	0x00	0x0000
TMR9_STCTRL	0x08	0x0000
TMR9_IDEN	0x0C	0x0000
TMR9_ISTS	0x10	0x0000
TMR9_SWEVT	0x14	0x0000
TMR9_CM1	0x18	0x0000
TMR9_CCTRL	0x20	0x0000
TMR9_CVAL	0x24	0x0000
TMR9_DIV	0x28	0x0000
TMR9_PR	0x2C	0x0000
TMR9_C1DT	0x34	0x0000 0000
TMR9_C2DT	0x38	0x0000 0000

14.2.4.1 Control register1 (TMR9_CTRL1)

Bit	Register	Reset value	Type	Description
Bit 15: 10	Reserved	0x00	resd	Kept at its default value
Bit 9: 8	CLKDIV	0x0	rw	Clock divider This field is used to define the relationship between digital filter sampling frequency (f_{DTS}) and timer clock frequency (f_{CK_INT}). 00: No division, $f_{DTS}=f_{CK\_INT}$ 01: Divided by 2, $f_{DTS}=f_{CK\_INT}/2$ 10: Divided by 4, $f_{DTS}=f_{CK\_INT}/4$ 11: Reserved
Bit 7	PRBEN	0x0	rw	Period buffer enable 0: Period buffer is disabled 1: Period buffer is enabled
Bit 6: 4	Reserved	0x0	resd	Kept at its default value
Bit 3	OCMEN	0x0	rw	One cycle mode enable This bit is use to select whether to stop counting at an update event 0: The counter does not stop at an update event 1: The counter stops at an update event
Bit 2	OVFS	0x0	rw	Overflow event source This bit is used to select overflow event or DMA request sources. 0: Counter overflow, setting the OVFSWTR bit or overflow event generated by slave timer controller 1: Only counter overflow generates an overflow event
Bit 1	OVFEN	0x0	rw	Overflow event enable 0: Enabled 1: Disabled
Bit 0	TMREN	0x0	rw	TMR enable

	0: Enabled 1: Disabled

14.2.4.2 Slave timer control register (TMR9_STCTRL)

Bit	Register	Reset value	Type	Description
Bit 15:7	Reserved	0x000	resd	Kept at its default value
Bit 6: 4	STIS	0x0	rw	Subordinate TMR input selection This field is used to select the subordinate TMR input. 000: Internal selection 0 (IS0) 001: Internal selection 1 (IS1) 010: Internal selection 2 (IS2) 011: Internal selection 3 (IS3) 100: C1IRAW input detector (C1INC) 101: Filtered input 1 (C1IF1) 110: Filtered input 2 (C1IF2) 111: Reserved Pleaser refer to Table 14-6 for more information on ISx for each timer.
Bit 3	Reserved	0x0	resd	Kept at its default value
Bit 2: 0	SMSEL	0x0	rw	Subordinate TMR mode selection 000: Slave mode is disabled 001: Encoder mode A 010: Encoder mode B 011: Encoder mode C 100: Reset mode —Rising edge of the TRGIN input reinitializes the counter 101: Suspend mode — The counter starts counting when the TRGIN is high 110: Trigger mode — A trigger event is generated at the rising edge of the TRGIN input 111: External clock mode A — Rising edge of the TRGIN input clocks the counter Note: Please refer to count mode section for details on encoder mode A/B/C.

14.2.4.3 DMA/interrupt enable register (TMR9_IDEN)

Bit	Register	Reset value	Type	Description
Bit 15:7	Reserved	0x0	resd	Kept at its default value.
Bit 6	TIEN	0x0	rw	Trigger interrupt enable 0: Disabled 1: Enabled
Bit 5:3	Reserved	0x0	resd	Kept at its default value.
Bit 2	C2IEN	0x0	rw	Channel 2 interrupt enable 0: Disabled 1: Enabled
Bit 1	C1IEN	0x0	rw	Channel 1 interrupt enable 0: Disabled 1: Enabled
Bit 0	OVFIEN	0x0	rw	Overflow interrupt enable 0: Disabled 1: Enabled

14.2.4.4 Interrupt status register (TMR9_ISTS)

Bit	Register	Reset value	Type	Description
Bit 15: 11	Reserved	0x00	resd	Kept at its default value.
Bit 10	C2RF	0x0	rw0c	Channel 2 recapture flag Please refer to C1RF description.
Bit 9	C1RF	0x0	rw0c	Channel 1 recapture flag This bit indicates whether a recapture is detected when C1IF=1. This bit is set by hardware, and cleared by writing “0”. 0: No capture is detected 1: Capture is detected.
Bit 8: 7	Reserved	0x0	resd	Kept at its default value.
Bit 6	TRGIF	0x0	rw0c	Trigger interrupt flag This bit is set by hardware on a trigger event. It is cleard by writing “0”. 0: No trigger event occurs 1: Trigger event is generated. Trigger event: an active edge is detected on TRGIN input, or any edge in suspend mode.
Bit 5:3	Reserved	0x0	resd	Kept at its default value.
Bit 2	C2IF	0x0	rw0c	Channel 2 interrupt flag Please refer to C1IF description.
Bit 1	C1IF	0x0	rw0c	Channel 1 interrupt flag If the channel 1 is configured as input mode: This bit is set by hardware on a capture event. It is cleared by software or read access to the TMRx_C1DT 0: No capture event occurs 1: Capture event is generated If the channel 1 is configured as output mode: This bit is set by hardware on a compare event. It is cleared by software. 0: No compare event occurs 1: Compare event is generated
Bit 0	OVFIF	0x0	rw0c	Overflow interrupt flag This bit is set by hardware on an overflow event. It is cleared by software. 0: No overflow event occurs 1: Overflow event is generated.

14.2.4.5 Software event register (TMR9_SWEVT)

Bit	Register	Reset value	Type	Description
Bit 15: 7	Reserved	0x000	resd	Kept at its default value.
Bit 6	TRGSWTR	0x0	rw	Trigger event triggered by software This bit is set by software to generate a trigger event. 0: No effect 1: Generate a trigger event.
Bit 5:3	Reserved	0x0	resd	Kept at its default value.
Bit 2	C2SWTR	0x0	wo	Channel 2 event triggered by software Please refer to C1M description
Bit 1	C1SWTR	0x0	wo	Channel 1 event triggered by software This bit is set by software to generate a channel 1 event. 0: No effect 1: Generate a channel 1 event.
Bit 0	OVFSWTR	0x0	wo	Overflow event triggered by software

				This bit is set by software to generate an overflow event. 0: No effect 1: Generate an overflow event.

14.2.4.6 Channel mode register1 (TMR9_CM1)

The channel can be used in input (capture mode) or output (compare mode). The direction of a channel is defined by the corresponding CxC bits. All the other bits of this register have different functons in input and output modes. The CxOx describes its function in output mode when the channel is in output mode, while the CxIx describes its function in output mode when the channel is in input mode. Attention must be given to the fact that the same bit can have different functions in input mode and output mode.

Output compare mode:

Bit	Register	Reset value	Type	Description
Bit 15	Reserved	0x0	resd	Kept at its default value.
Bit 14: 12	C2OCTRL	0x0	rw	Channel 2 output control
Bit 11	C2OBEN	0x0	rw	Channel 2 output buffer enable
Bit 10	C2OIEN	0x0	rw	Channel 2 output enable immediately
Bit 9: 8	C2C	0x0	rw	Channel 2 configuration This field is used to define the direction of the channel 2 (input or output), and the selection of input pin when C2EN='0': 00: Output 01: Input,， C2IN is mapped on C2IFP2 10: Input, C2IN is mapped on C1IFP2 11: Input, C2IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS register.
Bit 7	Reserved	0x0	resd	Kept at its default value.
Bit 6: 4	C1OCTRL	0x0	rw	Channel 1 output control This field defines the behavior of the original signal C1ORAW. 000: Disconnected. C1ORAW is disconnected from C1OUT; 001: C1ORAW is high when TMR9_CVAL=TMR9_C1DT 010: C1ORAW is low when TMR9_CVAL=TMR9_C1DT 011: Switch C1ORAW level when TMR9_CVAL=TMRx_C1DT 100: C1ORAW is forced low 101: C1ORAW is forced high. 110: PWM mode A – OWCDIR=0, C1ORAW is high once TMR9_C1DT>TMR9_CVAL, else low; – OWCDIR=1, C1ORAW is low once TMR9_ C1DT <TMR9_CVAL, else high; 111: PWM mode B – OWCDIR=0, C1ORAW is low once TMR9_ C1DT >TMR9_CVAL, else high; – OWCDIR=1, C1ORAW is high once TMR9_ C1DT <TMR9_CVAL, else low. *Note: In the configurations othern than 000', the C1OUT is connected to C1ORAW. The C1OUT output level is not only subject to the changes of C1ORAW, but also the output polarity set by CCTRL.*
Bit 3	C1OBEN	0x0	rw	Channel 1 output buffer enable

				0: Buffer function of TMR9_C1DT is disabled. The new value written to the TMR9_C1DT takes effect immediately. 1: Buffer function of TMR9_C1DT is enabled. The value to be written to the TMR9_C1DT is stored in the buffer register, and can be sent to the TMR9_C1DT register only on an overflow event.
Bit 2	C1OIEN	0x0	rw	Channel 1 output enable immediately In PWM mode A or B, this bit is used to accelerate the channel 1 output's response to the trigger event. 0: Need to compare the CVAL with C1DT before generating an output 1: No need to compare the CVAL and C1DT. An output is generated immediately when a trigger event occurs.
Bit 1: 0	C1C	0x0	rw	Channel 1 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C1EN='0': 00: Output 01: Input, C1IN is mapped on C1IFP1 10: Input, C1IN is mapped on C2IFP1 11: Input, C1IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

Input capture mode:

Bit	Register	Reset value	Type	Description
Bit 15: 12	C2DF	0x0	rw	Channel 2 digital filter
Bit 11: 10	C2IDIV	0x0	rw	Channel 2 input divider
Bit 9: 8	C2C	0x0	rw	Channel 2 configuration This field is used to define the direction of the channel 2 (input or output), and the selection of input pin when C2EN='0': 00: Output 01: Input, C2IN is mapped on C2IFP2 10: Input, C2IN is mapped on C1IFP2 11: Input, C2IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.
Bit 7: 4	C1DF	0x0	rw	Channel 1 digital filter This field defines the digital filter of the channel 1. N stands for the number of filtering, indicating that the input edge can pass the filter only after N sampling events. 0000: No filter, sampling is done at f_{DTS} 1000: $f_{SAMPLING}=f_{DTS}/8$, N=6 0001: $f_{SAMPLING}=f_{CK\_INT}$, N=2 1001: $f_{SAMPLING}=f_{DTS}/8$, N=8 0010: $f_{SAMPLING}=f_{CK\_INT}$, N=4 1010: $f_{SAMPLING}=f_{DTS}/16$, N=5 0011: $f_{SAMPLING}=f_{CK\_INT}$, N=8 1011: $f_{SAMPLING}=f_{DTS}/16$, N=6 0100: $f_{SAMPLING}=f_{DTS}/2$, N=6 1100: $f_{SAMPLING}=f_{DTS}/16$, N=8 0101: $f_{SAMPLING}=f_{DTS}/2$, N=8 1101: $f_{SAMPLING}=f_{DTS}/32$, N=5 0110: $f_{SMPLING}=f_{DTS}/4$, N=6 1110: $f_{SAMPLING}=f_{DTS}/32$, N=6 0111: $f_{SAMPLING}=f_{DTS}/4$, N=8

				1111: $f_{SAMPLING}=f_{DTS}/32$, N=8
Bit 3: 2	C1IDIV	0x0	rw	Channel 1 input divider This field defines Channel 1 input divider. 00: No divider. An input capture is generated at each active edge. 01: An input compare is generated every 2 active edges 10: An input compare is generated every 4 active edges 11: An input compare is generated every 8 active edges Note: the divider is reset once C1EN='0'
Bit 1: 0	C1C	0x0	rw	Channel 1 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C1EN='0': 00: Output 01: Input, C1IN is mapped on C1IFP1 10: Input, C1IN is mapped on C2IFP1 11: Input, C1IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

14.2.4.7 Channel control register (TMR9_CCTRL)

Bit	Register	Reset value	Type	Description
Bit 15: 8	Reserved	0x00	resd	Kept at its default value.
Bit 7	C2CP	0x0	rw	Channel 2 complementary polarity Pleaser refer to C1P description.
Bit 6	Reserved	0x0	resd	Kept at its default value.
Bit 5	C2P	0x0	rw	Channel 2 polarity Pleaser refer to C1P description.
Bit 4	C2EN	0x0	rw	Channel 2 enable Pleaser refer to C1EN description.
Bit 3	C1CP	0x0	rw	Channel 1 complementary polarity Pleaser refer to C1P description.
Bit 2	Reserved	0x0	resd	Kept at its default value.
Bit 1	C1P	0x0	rw	Channel 1 polarity When the channel 1 is configured as output mode: 0: C1OUT is active high 1: C1OUT is active low When the channel 1 is configured as input mode: 00: C1IN rising edge active. When used as external trigger, C1IN is not inverted. 01: C1IN falling edge active. When used as external trigger, C1IN is inverted. 10: Reserved 11: C1IN both edges active. When used as external trigger, C1IN is not inverted.
Bit0	C1EN	0x0	rw	Channel 1 enable 0: Input or output is disabled 1: Input or output is enabled

Table 14-8 Standard CxOUT channel output control bit

CxEN bit	CxOUT output state
0	Output disabled (CxOUT=0)
1	CxOUT = CxORAW + polarity

Note: The state of the external I/O pins connected to the standard CxOUT channel depends on the CxOUT channel state and the GPIO and IOMUX registers.

14.2.4.8 Counter value (TMR9_CVAL)

Bit	Register	Reset value	Type	Description
Bit 15: 0	CVAL	0x0000	rw	Counter value

14.2.4.9 Division value (TMR9_DIV)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DIV	0x0000	rw	Divider value The counter clock frequency $f_{CK\_CNT} = f_{TMR\_CLK}$ /(DIV[15: 0]+1). DIV contains the value written at an overflow event.

14.2.4.10 Period register (TMR9_PR)

Bit	Register	Reset value	Type	Description
Bit 15: 0	PR	0x0000	rw	Period value This defines the period value of the TMRx counter. The timer stops working when the period value is 0.

14.2.4.11 Channel 1 data register (TMR9_C1DT)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 0	C1DT	0x0000	rw	Channel 1 data register When the channel 1 is configured as input mode: The C1DT is the CVAL value stored by the last channel 1 input event (C1IN) When the channel 1 is configured as output mode: C1DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C1OBEN bit, and the corresponding output is generated on C1OUT as configured.

14.2.4.12 Channel 2 data register (TMR9_C2DT)

Bit	Register	Reset value	Type	Description
Bit 31: 16	C2DT	0x0000	resd	Kept at its default value.
Bit 15: 0	C2DT	0x0000	rw	Channel 2 data register When the channel 2 is configured as input mode: The C2DT is the CVAL value stored by the last channel 2 input event (C1IN) When the channel 2 is configured as output mode: C2DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C2OBEN bit, and the corresponding output is generated on C2OUT as configured.

14.2.5 TMR10 and TMR11 registers

These peripheral registers must be accessed by word (32 bits).

TMR10 and TMR11 register are mapped into a 1-bit addressable space.

Table 14-9 TMRx register map and reset value

Register	Offset	Reset value
TMRx_CTRL1	0x00	0x0000
TMRx_IDEN	0x0C	0x0000
TMRx_ISTS	0x10	0x0000
TMRx_SWEVT	0x14	0x0000
TMRx_CM1	0x18	0x0000
TMRx_CCTRL	0x20	0x0000
TMRx_CVAL	0x24	0x0000
TMRx_DIV	0x28	0x0000
TMRx_PR	0x2C	0x0000
TMRx_C1DT	0x34	0x0000

14.2.5.1 Control register1 (TMRx_CTRL1)

Bit	Register	Reset value	Type	Description
Bit 15: 10	Reserved	0x00	resd	Kept at its default value
Bit 9: 8	CLKDIV	0x0	rw	Clock divider This field is used to define the relationship between digital filter sampling frequency (f_{DTS}) and timer clock frequency (f_{CK_INT}). 00: No division, $f_{DTS}=f_{CK\_INT}$ 01: Divided by 2, $f_{DTS}=f_{CK\_INT}/2$ 10: Divided by 4, $f_{DTS}=f_{CK\_INT}/4$ 11: Reserved
Bit 7	PRBEN	0x0	rw	Period buffer enable 0: Period buffer is disabled 1: Period buffer is enabled
Bit 6: 4	Reserved	0x0	resd	Default value
Bit 3	OCMEN	0x0	rw	One cycle mode enable This bit is use to select whether to stop counting at an update event 0: The counter does not stop at an update event 1: The counter stops at an update event
Bit 2	OVFS	0x0	rw	Overflow event source This bit is used to select overflow event or DMA request sources. 0: Counter overflow, setting the OVFSWTR bit or overflow event generated by slave timer controller 1: Only counter overflow generates an overflow event
Bit 1	OVFEN	0x0	rw	Overflow event enable 0: Enabled 1: Disabled
Bit 0	TMREN	0x0	rw	TMR enable 0: Enabled 1: Disabled

14.2.5.2 DMA/interrupt enable register (TMRx_IDEN)

Bit	Register	Reset value	Type	Description
Bit 15:2	Reserved	0x0	resd	Kept at its default value
Bit 1	C1IEN	0x0	rw	Channel 1 interrupt enable 0: Disabled 1: Enabled
Bit 0	OVFIEN	0x0	rw	Overflow interrupt enable 0: Disabled 1: Enabled

14.2.5.3 Interrupt status register (TMRx_ISTS)

Bit	Register	Reset value	Type	Description
Bit 15: 10	Reserved	0x00	resd	Kept at its default value.
Bit 9	C1RF	0x0	rw0c	Channel 1 recapture flag This bit indicates whether a recapture is detected when C1IF=1. This bit is set by hardware, and cleared by writing “0”. 0: No capture is detected 1: Capture is detected.
Bit 8: 2	Reserved	0x00	resd	Kept at its default value.
Bit 1	C1IF	0x0	rw0c	Channel 1 interrupt flag If the channel 1 is configured as input mode: This bit is set by hardware on a capture event. It is cleared by software or read access to the TMRx_C1DT 0: No capture event occurs 1: Capture event is generated If the channel 1 is configured as output mode: This bit is set by hardware on a compare event. It is cleared by software. 0: No compare event occurs 1: Compare event is generated
Bit 0	OVFIF	0x0	rw0c	Overflow interrupt flag This bit is set by hardware on an overflow event. It is cleared by software. 0: No overflow event occurs 1: Overflow event is generated.

14.2.5.4 Software event register (TMRx_SWEVT)

Bit	Register	Reset value	Type	Description
Bit 15: 2	Reserved	0x0000	resd	Kept at its default value.
Bit 1	C1SWTR	0x0	wo	Channel 1 event triggered by software This bit is set by software to generate a channel 1 event. 0: No effect 1: Generate a channel 1 event.
Bit 0	OVFSWTR	0x0	wo	Overflow event triggered by software This bit is set by software to generate an overflow event. 0: No effect 1: Generate an overflow event.

14.2.5.5 Channel mode register1 (TMRx_CM1)

The channel can be used in input (capture mode) or output (compare mode). The direction of a channel is defined by the corresponding CxC bits. All the other bits of this register have different functons in input and output modes. The CxOx describes its function in output mode when the channel is in output mode, while the CxIx describes its function in output mode when the channel is in input mode. Attention must be given to the fact that the same bit can have different functions in input mode and output mode.

Output compare mode:

Bit	Register	Reset value	Type	Description
Bit 15:7	Reserved	0x000	resd	Kept at its default value.
Bit 6: 4	C1OCTRL	0x0	rw	Channel 1 output control This field defines the behavior of the original signal C1ORAW. 000: Disconnected. C1ORAW is disconnected from C1OUT; 001: C1ORAW is high when TMRx_CVAL=TMRx_C1DT 010: C1ORAW is low when TMRx_CVAL=TMRx_C1DT 011: Switch C1ORAW level when TMRx_CVAL=TMRx_C1DT 100: C1ORAW is forced low 101: C1ORAW is forced high. 110: PWM mode A －OWCDIR=0, C1ORAW is high once TMRx_C1DT>TMRx_CVAL, else low; －OWCDIR=1, C1ORAW is low once TMRx_ C1DT <TMRx_CVAL, else high; 111: PWM mode B －OWCDIR=0, C1ORAW is low once TMRx_ C1DT >TMRx_CVAL, else high; －OWCDIR=1, C1ORAW is high once TMRx_ C1DT <TMRx_CVAL, else low. *Note: In the configurations othern than 000', the C1OUT is connected to C1ORAW. The C1OUT output level is not only subject to the changes of C1ORAW, but also the output polarity set by CCTRL.*
Bit 3	C1OBEN	0x0	rw	Channel 1 output buffer enable 0: Buffer function of TMRx_C1DT is disabled. The new value written to the TMRx_C1DT takes effect immediately. 1: Buffer function of TMRx_C1DT is enabled. The value to be written to the TMRx_C1DT is stored in the buffer register, and can be sent to the TMRx_C1DT register only on an overflow event.
Bit 2	C1OIEN	0x0	rw	Channel 1 output enable immediately In PWM mode A or B, this bit is used to accelerate the channel 1 output's response to the trigger event. 0: Need to compare the CVAL with C1DT before generating an output 1: No need to compare the CVAL and C1DT. An output is generated immediately when a trigger event occurs.
Bit 1: 0	C1C	0x0	rw	Channel 1 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C1EN='0': 00: Output 01: Input, C1IN is mapped on C1IFP1 10: Reserved

				11: Reserved

Input capture mode:

Bit	Register	Reset value	Type	Description
Bit 15: 8	Reserved	0x00	resd	Kept at its default value.
Bit 7: 4	C1DF	0x0	rw	Channel 1 digital filter This field defines the digital filter of the channel 1. N stands for the number of filtering, indicating that the input edge can pass the filter only after N sampling events. 0000: No filter, sampling is done at f_{DTS} 1000: $f_{SAMPLING}=f_{DTS}/8$, N=6 0001: $f_{SAMPLING}=f_{CK\_INT}$, N=2 1001: $f_{SAMPLING}=f_{DTS}/8$, N=8 0010: $f_{SAMPLING}=f_{CK\_INT}$, N=4 1010: $f_{SAMPLING}=f_{DTS}/16$, N=5 0011: $f_{SAMPLING}=f_{CK\_INT}$, N=8 1011: $f_{SAMPLING}=f_{DTS}/16$, N=6 0100: $f_{SAMPLING}=f_{DTS}/2$, N=6 1100: $f_{SAMPLING}=f_{DTS}/16$, N=8 0101: $f_{SAMPLING}=f_{DTS}/2$, N=8 1101: $f_{SAMPLING}=f_{DTS}/32$, N=5 0110: $f_{SMPLING}=f_{DTS}/4$, N=6 1110: $f_{SAMPLING}=f_{DTS}/32$, N=6 0111: $f_{SAMPLING}=f_{DTS}/4$, N=8 1111: $f_{SAMPLING}=f_{DTS}/32$, N=8
Bit 3: 2	C1IDIV	0x0	rw	Channel 1 input divider This field defines Channel 1 input divider. 00: No divider. An input capture is generated at each active edge. 01: An input compare is generated every 2 active edges 10: An input compare is generated every 4 active edges 11: An input compare is generated every 8 active edges Note: the divider is reset once C1EN='0'
Bit 1: 0	C1C	0x0	rw	Channel 1 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C1EN='0': 00: Output 01: Input, C1IN is mapped on C1IFP1 10: Reserved 11: Reserved

14.2.5.6 Channel control register (TMRx_CCTRL)

Bit	Register	Reset value	Type	Description
Bit 15: 4	Reserved	0x0	resd	Kept at its default value.
Bit 3	C1CP	0x0	rw	Channel 1 complementary polarity Refer to C1P description on how to define the active edge of an input signal.
Bit 1	C1P	0x0	rw	Channel 1 polarity When the channel 1 is configured as output mode: 0: C1OUT is active high 1: C1OUT is active low When the channel 1 is configured as input mode: 00: C1IN rising edge active. When used as external trigger, C1IN is not inverted. 01: C1IN falling edge active. When used as external trigger, C1IN is inverted. 10: Reserved 11: C1IN both edges active. When used as external trigger, C1IN is not inverted.
Bit 0	C1EN	0x0	rw	Channel 1 enable 0: Input or output is disabled 1: Input or output is enabled

Table 14-10 Standard CxOUT channel output control bit

CxEN bit	CxOUT output state
0	Output disabled (CxOUT=0)
1	CxOUT = CxORAW + polarity

Note: The state of the external I/O pins connected to the standard CxOUT channel depends on the CxOUT channel state and the GPIO and IOMUX registers.

14.2.5.7 Counter value (TMRx_CVAL)

Bit	Register	Reset value	Type	Description
Bit 15: 0	CVAL	0x0000	rw	Counter value

14.2.5.8 Division value (TMRx_DIV)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DIV	0x0000	rw	Divider value The counter clock frequency $f_{CK\_CNT} = f_{TMR\_CLK}$ /(DIV[15: 0]+1). DIV contains the value written at an overflow event.

14.2.5.9 Period register (TMRx_PR)

Bit	Register	Reset value	Type	Description
Bit 15: 0	PR	0x0000	rw	Period value This defines the period value of the TMRx counter. The timer stops working when the period value is 0.

14.2.5.10 Channel 1 data register (TMRx_C1DT)

Bit	Register	Reset value	Type	Description
Bit 15: 0	C1DT	0x0000	rw	Channel 1 data register When the channel 1 is configured as input mode: The C1DT is the CVAL value stored by the last channel 1 input event (C1IN) When the channel 1 is configured as output mode: C1DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately

depends on the C1OBEN bit, and the corresponding output is generated on C1OUT as configured.

14.3 Advanced-control timers (TMR1 and TMR8)

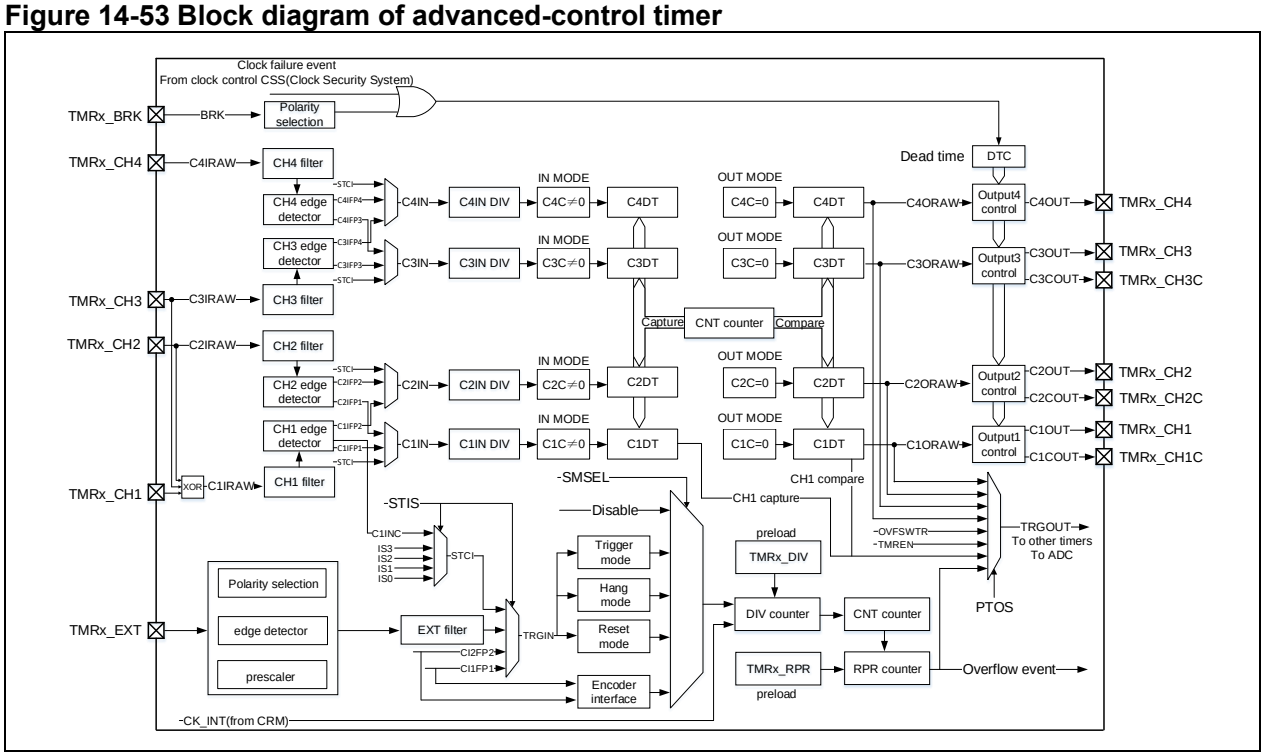
14.3.1 TMR1 and TMR8 introduction

Each of the advanced-control timer (TMR1 and TMR8) consists of a 16-bit counter supporting up, down, up/down (bidirectional) counting modes, four capture/compare registers, and four independent channels to achieve embedded dead-time, input capture and programmable PWM output.

14.3.2 TMR1 and TMR8 main features

- Souce of counter clock: internal clock, external clock an internal trigger input
- 16-bit up, down, up/down, repetition and encoder mode counter
- 4 independent channels for input capture, output compare, PWM generation, one-pulse mode output and embedded dead-time
- 3 independent channesl for complementary output
- TMR break function
- Synchronization control between master and slave timers
- Interrrupt/DMA is generated at overflow event, trigger event, break signal input and channel event
- Support TMR burst DMA transfer

Figure 14-53 Block diagram of advanced-control timer

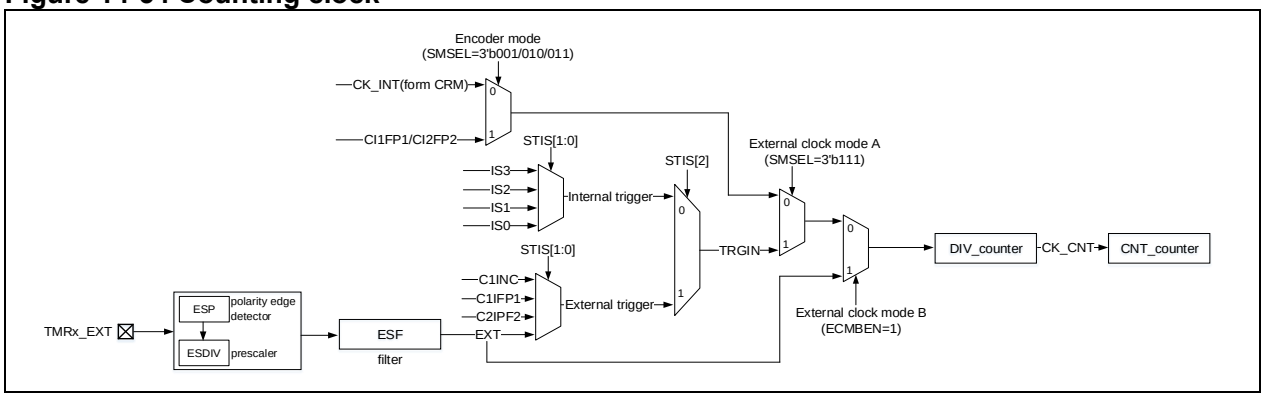


14.3.3 TMR1 and TMR8 functional overview

14.3.3.1 Counting clock

The count clock of TMR1 and TMR8 can be provided by the internal clock (CK_INT), external clock (external clock mode A and B) and internal trigger input (ISx)

Figure 14-54 Counting clock



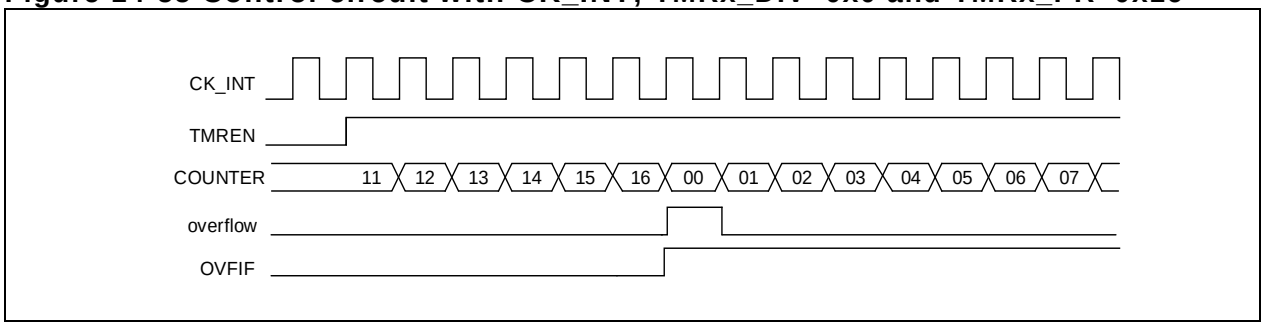
Internal clock (CK_INT)

By default, the CK_INT divided by the prescaler is used to drive the counter to start counting. When TMR's APB clock prescaler factor is 1, the CK_INT frequency is equal to that of APB, otherwise, it doubles the APB clock frequency.

Configuration procedures:

- Select a counting mode by setting the TWCMSEL[1:0] in TMRx_CTRL1 register. If an unidirectional aligned counting mode is selected, it is necessary to select a counting direction through the OWCDIR in TMRx_CTRL1 register.
- Set counting frequency through TMRx_DIV register
- Set counting cycles through TMRx_PR register
- Eanble a counter by setting the TMREN bit in the TMRx_CTRL1 register

Figure 14-55 Control circuit with CK_INT, TMRx_DIV=0x0 and TMRx_PR=0x16



External clock (TRGIN/EXT)

The counter clock can be provided by two external clock sources, namely, TRGIN and EXT signals.

SMSEL=3'b111: External clock mode A is selected. Select an external clock source TRGIN signal by setting the STIS[2: 0] bit to drive the counter to start counting.

The external clock sources include: C1INC (STIS=3'b100, channel 1 rising edge and falling edge), C1IFP1 (STIS=3'b101, the channel 1 signal with filtering and polarity selection), C2IFP2 (STIS=3'b110, a channel 2 signal with filtering and polarity selection) and EXT (STIS=3'b111, external input signal with polarity selection, frequency division and filtering).

ECMBEN=1: External clock mode B is selected. The counter is driven by external input that has gone through polarity selection, frequency division and filtering. The external clock mode B is equivalent to the external clock mode A which selects EXT signal as an external force TRGIN.

To use external clock mode A, follow the steps below:

-Set external source TRGIN parameters

If the TMRx_CH1 is used as a source of TRGIN, it is necessary to configure channel 1 input filter (C1DF[3:0] in TMRx_CM1 register) and channel 1 input polarity (C1P/C1CP in TMRx_CCTRL register);

If the TMRx_CH2 is used as source of TRGIN, it is necessary to configure channel 1 input filter (C2DF[3:0] in TMRx_CM1 register) and channel 2 input polarity (C2P/C2CP in TMRx_CCTR register);

If the TMRx_EXT is used as a source of TRGIN, it is necessary to configure the external signal

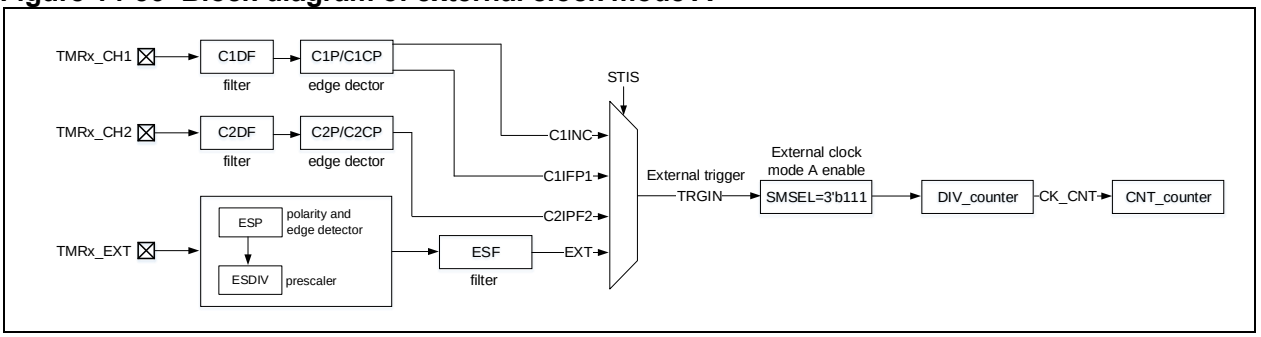
polarity (ESP in TMRx_STCTRL register), external signal frequency division (ESDIV[1:0] in TMRx_STCTRL) and external signal filter (ESF[3:0] in TMRx_STCTRL register).

- Set TRGIN signal source using the STIS[1:0] bit in TMRx_STCTRL register
- Enable external clock mode A by setting SMSEL=3'b111 in TMRx_STCTR register
- Set counting frequency through the DIV[15:0] in TMRx_DIV register
- Set counting period through the PR[15:0] in TMRx_PR register
- Enable counter through the TMREN bit in TMRx_CTRL1 register

To use external clock mode B, follow the steps below:

- Set external signal polarity through the ESP bit in TMRx_STCTRL register
- Set external signal frequency division through the ESDIV[1:0] bit in TMRx_STCTRL register
- Set external signal filter through the ESF[3:0] bit in TMRx_STCTRL register
- Enable external clock mode B through the ECMBEN bit in TMRx_STCTR register
- Set counting frequency through the DIV[15:0] bit in TMRx_DIV register
- Set counting period through the PR[15:0] bit in TMRx_PR register
- Enable counter through the TMREN in TMRx_CTRL1 register

Figure 14-56 Block diagram of external clock mode A



Note: The delay between the signal on the input side and the actual clock of the counter is due to the synchronization circuit.

Figure 14-57 Counting in external clock mode A, PR=0x32, DIV=0x0

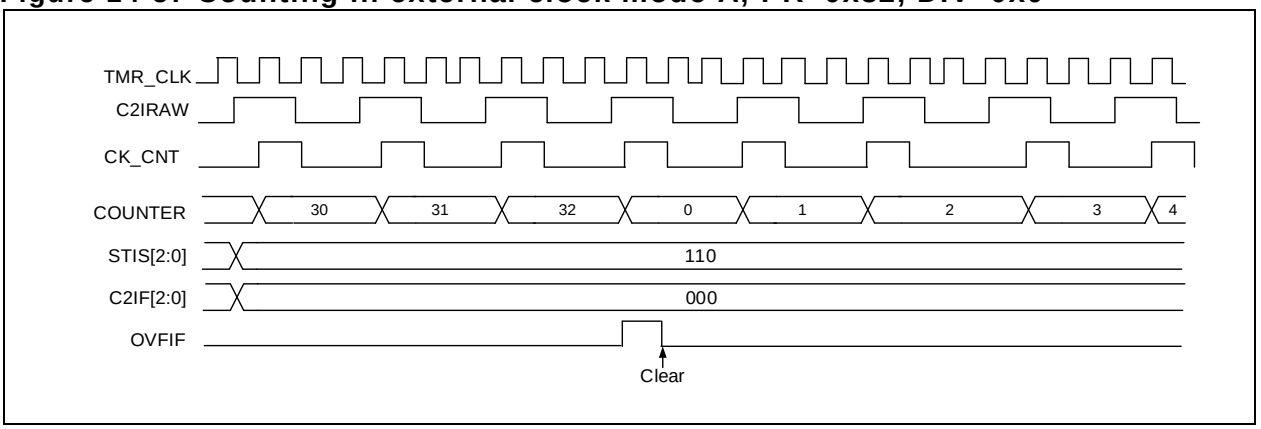


Figure 14-58 Block diagram of external clock mode B

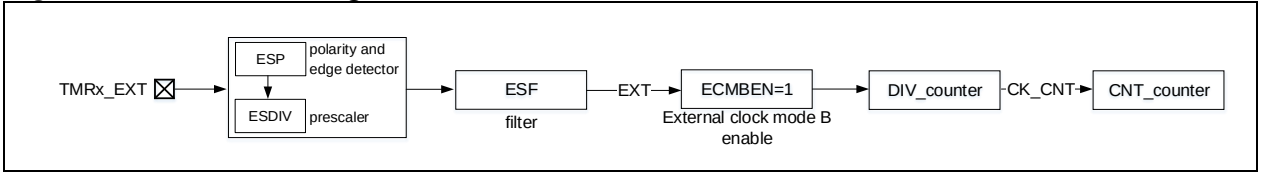
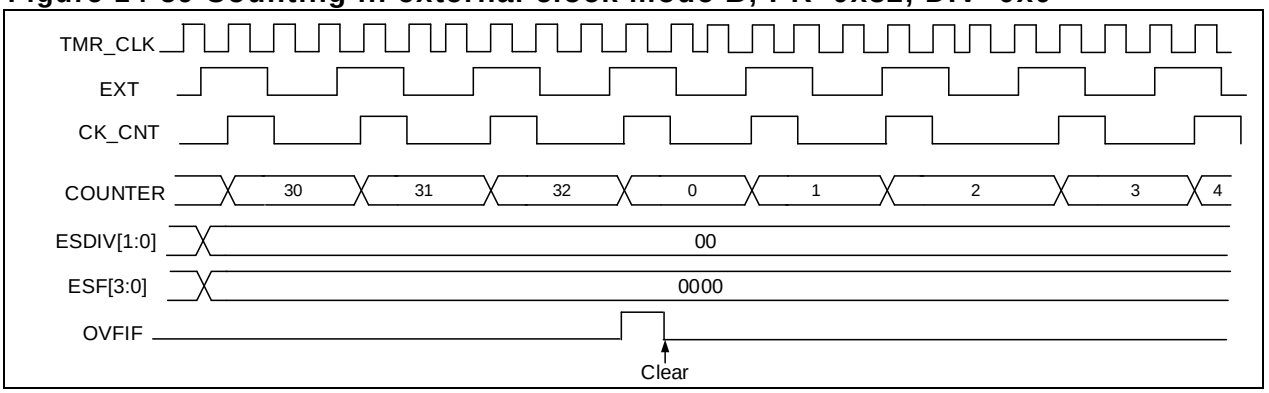


Note: The delay between the ext signal on the input side and the actual clock of the counter is due to the synchronization circuit.

Figure 14-59 Counting in external clock mode B, PR=0x32, DIV=0x0



Internal trigger input (ISx)

Timer synchronization allows interconnection between several timers. The TMR_CLK of one timer can be provided by the TRGOUT signal output by another timer. Set the STIS[2: 0] bit to select internal trigger signal to enable counting.

Each timer consists of a 16-bit prescaler, which is used to generate the CK_CNT that enables the counter to count. The frequency division relationship between the CK_CNT and TMR_CLK can be adjusted by setting the value of the TMRx_DIV register. The prescaler value can be modified at any time, but it takes effect only when the next overflow event occurs.

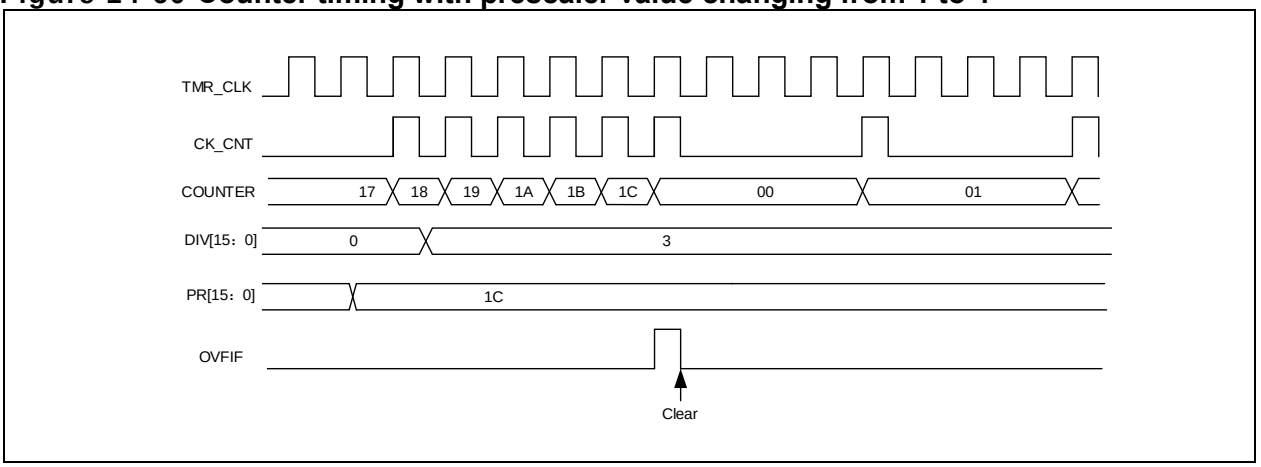
Below is the configuration procedure for interal trigger input:

- Set counting cycles through TMRx_PR register
- Set counting frequency through TMRx_DIV register
- Set counting modes through the TWCMSEL[1:0] in TMRx_CTRL1 register
- Select internal trigger by setting STIS[2:0]= 3’b000~3’b011 in TMRx_STCTRL register
- Select external clock mode A by setting SMSEL[2:0]=3’b111 in TMRx_STCTRL register
- Eable TMRx to start counting through the TMREN in TMRx_CTRL1 register

Table 14-11 TMRx internal trigger connection

Slave timer	IS0 (STIS=000)	IS1 (STIS=001)	IS2 (STIS=010)	IS3 (STIS=011)
TMR1	TMR5	TMR2	TMR3	TMR4
TMR8	TMR1	TMR2	TMR4	TMR5

Figure 14-60 Counter timing with prescaler value changing from 1 to 4



14.3.3.2 Counting mode

The advanced-control timer consists of a 16-bit counter supporting up, down, up/down counting modes.

The TMRx_PR register is used to define counting period of counter. The value in the TMRx_PR is immediately moved to the shadow register by deault. When the periodic buffer is enabled (PRBEN=1), the value in the TMRx_PR register is transferred to the shadow register only at an overflow event.

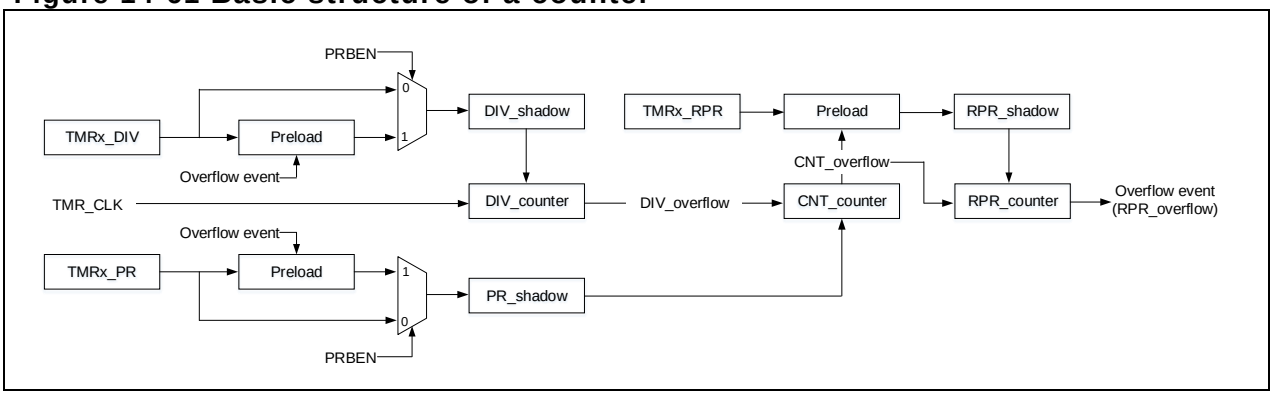
TMRx_DIV register is used to define the counter frequency of the counter. The counter counts once every DIV[15:0]+1 clock cycle. Similar to TMRx_PR register, after enabling periodic buffer, the value of the TMRx_DIV register are transferred into the shadow register at each overflow event.

Reading the TMRx_CNT register returns the current counter value. Writing the TMRx_CNT register will update the current counter value.

An overflow event is is enabled by default. It can be disabled by setting OVFEN=1 in the TMRx_CTRL1 register. The OVFS bit in the TMRx_CTRL1 register is used to select the source of an overflow event, which is, by default, counter overflow or underflow, setting OVFSWTR, reset signal generated by slave mode timer controller in reset mode. Once the OVFS is set, an overflow event is generated only when overflow or underflow occurs.

Settng the TMREN bit (TMREN=1) enables the timer to start counting. Base on synchronization logic, however, the actual enable signal TMR_EN is set 1 clock cycle after the TMREN is set.

Figure 14-61 Basic structure of a counter



Upcounting mode

Upcounting mode is enabled by setting CMSEL[1:0]=2'b00 and OWCDIR=1'b in the TMRx_CTRL1 register.

In upcounting mode, the counter counts from 0 to the value programmed in the TMRx_PR register, then restarts from 0, and generates a counter overflow event, with setting OVFIF=1. If the overflow event is disabled, the counter is no longer reloaded with the prescaler value and period value at a counter overflow event, otherwise, the counter is updated with the prescaler value and period value on an overflow event.

Figure 14-62 Overflow event when PRBEN=0

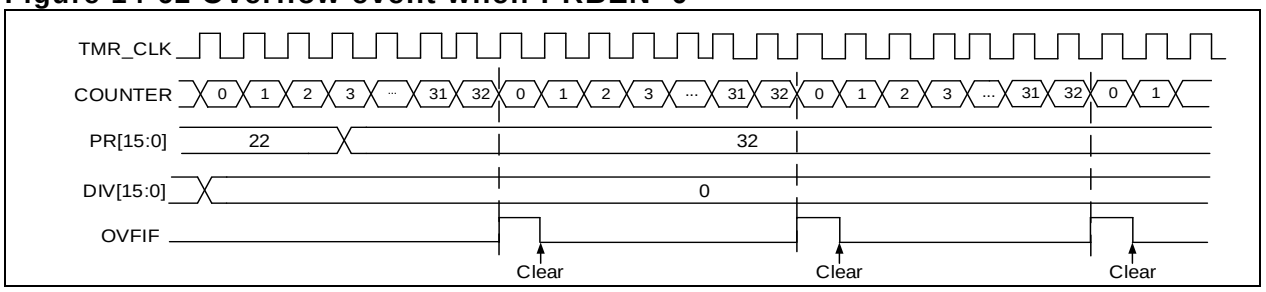


Figure 14-63 Overflow event when PRBEN=1

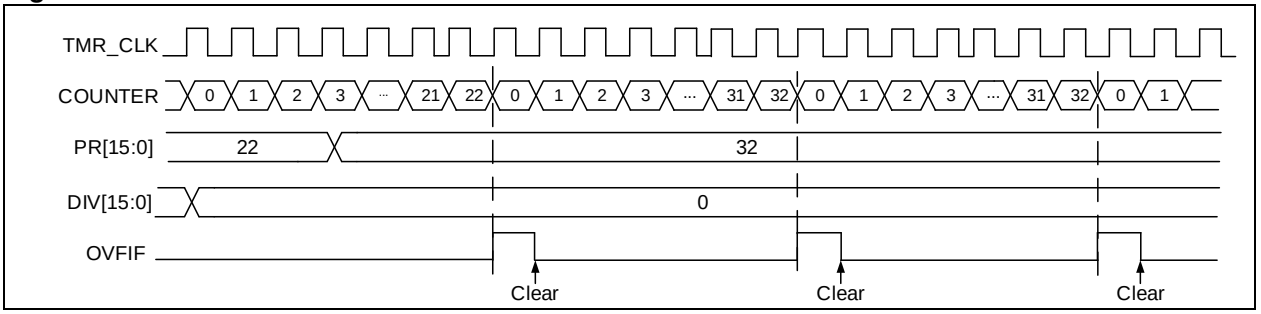
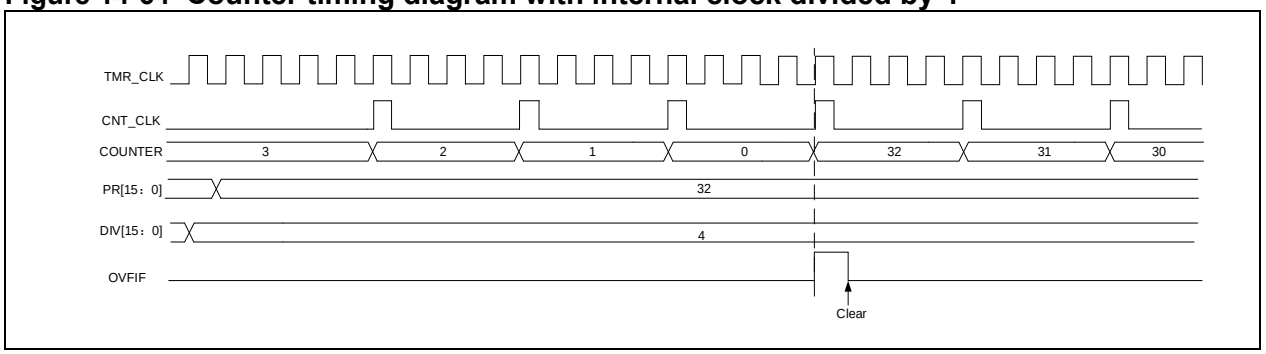


Downcounting mode

This downcounting mode is enabled by setting CMSEL[1:0]=2'b00 and OWCDIR=1'b1 in the TMRx_CTRL1 register.

In downcounting mode, the counter counts from the value programmed in the TMRx_PR register down to 0, and restarts from the value programmed in the TMRx_PR register, and generates a counter underflow event.

Figure 14-64 Counter timing diagram with internal clock divided by 4



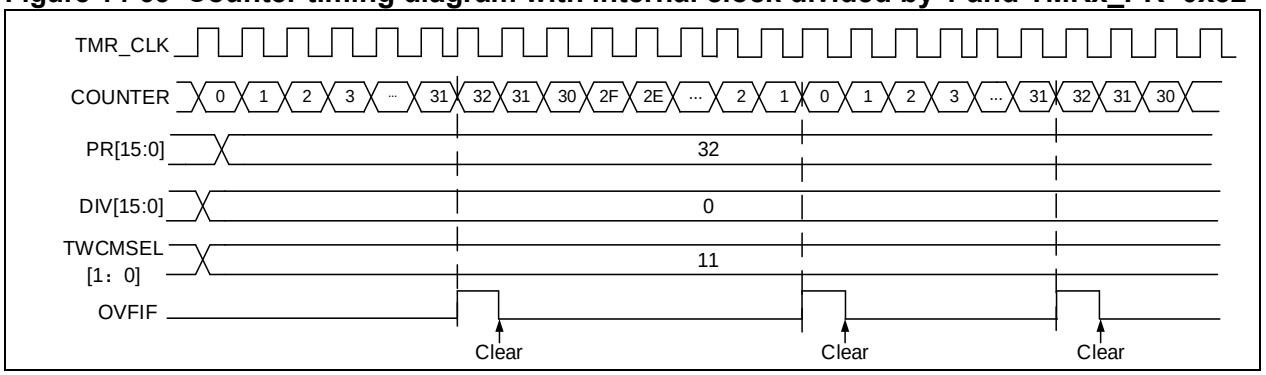
Up/down counting mode (center-aligned mode)

Up/down counting mode can be enabled by setting CMSEL[1:0]≠2'b00 in the TMRx_CTRL1 register. In up/down counting mode, the counter counts up/down alternatively. When the counter counts from the value programmed in the TMRx_PR register down to 1, an underflow event is generated, and then restarts counting from 0; When the counter counts from 0 to the value of the TMRx_PR register -1, an overflow event is generated, and then restarts counting from the value of the TMRx_PR register. The OWCDIR bit indicates the current counting direction.

The TWCMSEL[1:0] bit in the TMRx_CTRL1 register is used to select the condition under which the CxIF flag is set in two-way counting mode. In other words, when TWCMSEL[1:0]=2'b01 (counting mode 1) is selected, the CxIF flag is set only when the counter counts down; when TWCMSEL[1:0]=2'b10 (counting mode 2) is selected, the CxIF flag is set only when the counter counts up; when TWCMSEL[1:0]=2'b11 (counting mode 3) is selected, the CxIF flag is set when the counter counts up and down.

Note: The OWCDIR is ready-only in up/down counting mode.

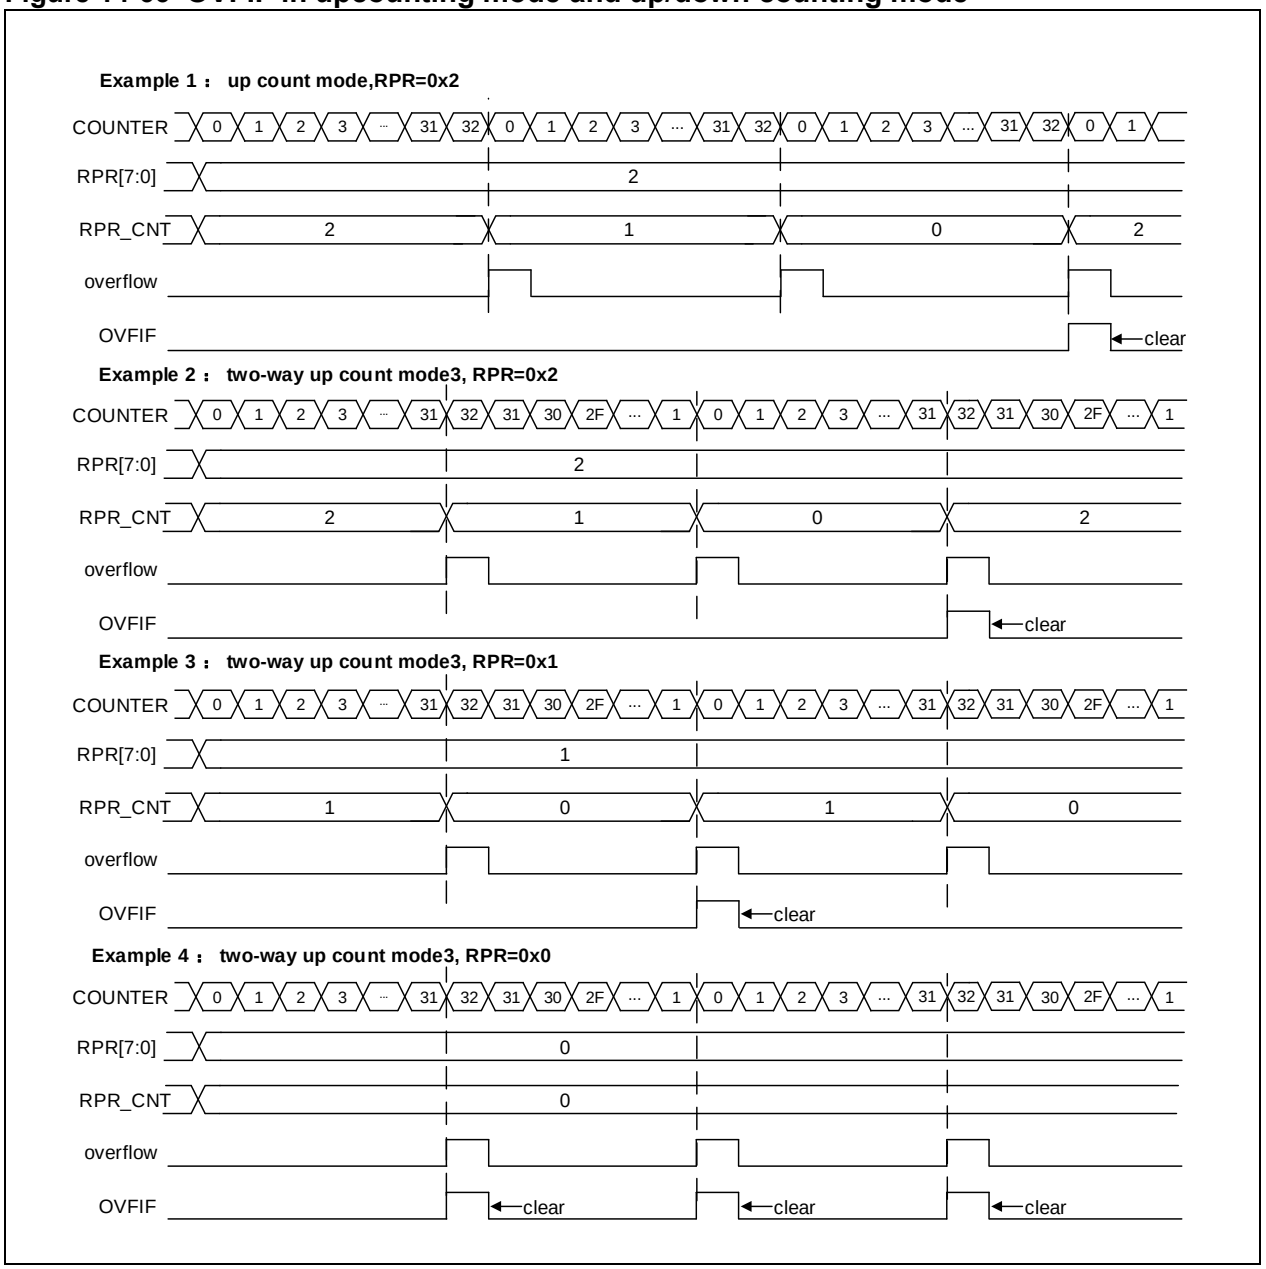
Figure 14-65 Counter timing diagram with internal clock divided by 1 and TMRx_PR=0x32



Repetition counter mode:

The TMRx_RPR register is used to set repetition counting mode. This mode is enabled when the The TMRx_RPR is not equal to 0. In this mode, an overflow event is generated when a counter overflow occurs (RPR[7:0]+1). The repetition counter is decremented at each counter overflow. An overflow event is generated when the repetition counter reaches 0. The frequency of the overflow event can be adjusted by setting the repettion counter value.

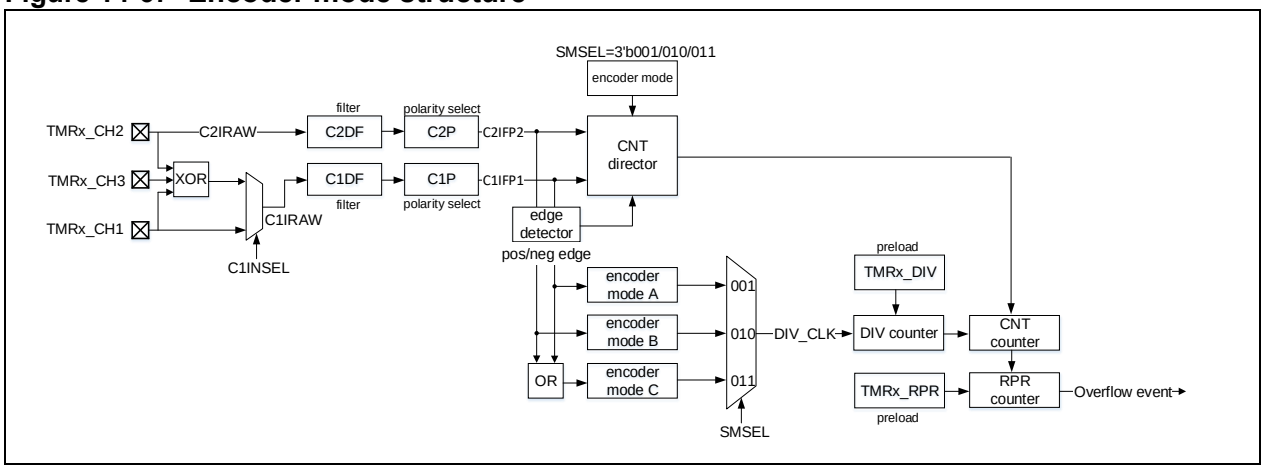
Figure 14-66 OVFIF in upcounting mode and up/down counting mode



Encoder interface mode

In this mode, the two input (TMRx_CH1 and TMRx_CH2) signals are required. Depending on the level on one input, the counter counts up or down on the edge of the other input signal. The OWCDIR bit indicates the direction of the counter.

Figure 14-67 Encoder mode structure



Encoder mode A: SMSEL=3'b001. The counter counts on the selected C1IFP1 edge (rising and falling edges), and the counting direction is dependent on the edge direction of C1IFP1 and the level of C2IFP2.

Encoder mode B: SMSEL=3'b010. The counter counts on the selected C2IFP2 edge (rising and falling edges), and the counting direction is dependent on the edge direction of C2IFP2 and the level of C1IFP1.

Encoder mode C: SMSEL=3'b011. The counter counts on both C1IFP1 and C2IFP2 edges (rising and falling edges). The counting direction is dependent on the C1IFP1 edge direction and C2IFP2 level, and C2IFP2 edge direction and C1IFP1 level.

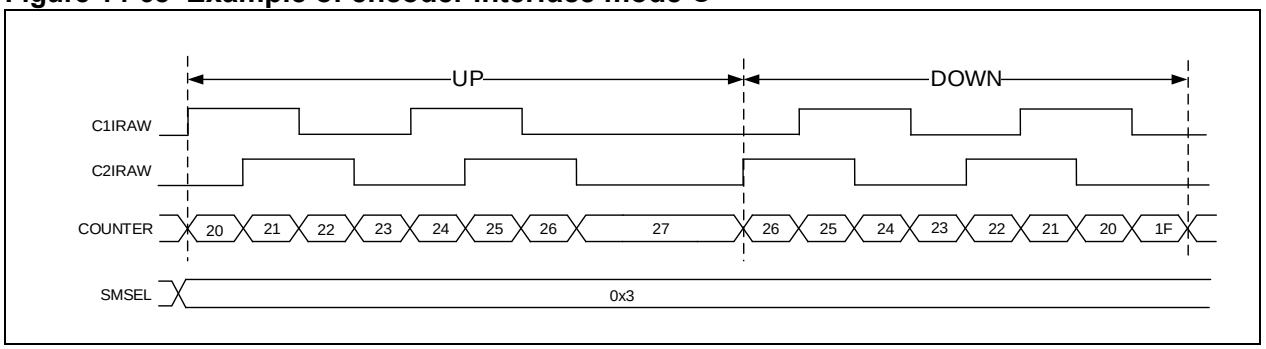
To use encoder mode, follow the procedures below:

- Set channel 1 input signal filtering through the C1DF[3:0] bit in the TMRx_CM1 register;
  Set channel 1 input signal active level through the C1P bit in the TMRx_CCTRL register
- Set channel 2 input signal filtering through the C2DF[3:0] bit in the TMRx_CM1 register;
  Set channel 2 input signal active level through the C2P bit in the TMRx_CCTRL register
- Set channel 1 as input mode through the C1C[1:0] bit in the TMRx_CM1 register;
  Set channel 2 as input mode through the C2C[1:0] bit in the TMRx_CM1 register
- Select encoder mode A (SMSEL=3'b001), encoder mode B (SMSEL=3'b010), or encoder mode C (SMSEL=3'b011) by setting the SMSEL[2:0] bit in the TMRx_STCTRL register
- Set counting cycles through the PR[15:0] bit in the TMRx_PR register
- Set counting frequency through the DIV[15:0] bit in the TMRx_DIV register
- Configure the corresponding IOs of TMRx_CH1 and TMRx_CH2 as multiplexed mode
- Enable counter through the TMREN bit in the TMRx_CTRL1 register

Table 14-12 Counting direction versus encoder signals

Active edge	Level on opposite signal (**C1INFP1 to** C2IFP2, **C2INFP2 to** C1IFP1)	**C1INFP1 signal**		**C2INFP2 signal**	
		Rising	**Falling**	**Rising**	**Falling**
Count on C1IFP1 only	High	Down	Up	No count	No count
	Low	Up	Down	No count	No count
Count on C2IFP2 only	High	No count	No count	Up	Down
	Low	No count	No count	Down	Up
Count on both C1IFP1 and C2IFP2	High	Down	Up	Up	Down
	Low	Up	Down	Down	Up

Figure 14-68 Example of encoder interface mode C



14.3.3.3 TMR input function

Each timer of TMR1 and TMR8 has four independent channels. Each channel can be configured as input or output. As input, each channel input is processed as follows:

- TMRx_CHx outputs the pre-processed CxIRAW. The C1INSEL bit is used to select the source of C1IRAW from TMRx_CH1 or the XOR-ed TMRx_CH1, TMRx_CH2 and TMRx_CH3.

  The sources of C2IRAW, C3IRAW and C4IRAW are TMRx_CH2, TMRx_CH3 and TMRx_CH4, respectively.
- CxIRAW inputs digital filter and outputs filtered CxIF signal. The digital filter uses the CxDF bit to program sampling frequency and sampling times.
- CxIF inputs edge detector, and outputs the CxIFPx signal after edge selection. The edge selection depends on both CxP and CxCP bits. It is possible to select input rising edge, falling edge or both edges.
- CxIFPx inputs capture signal selector, and outputs the CxIN signal after capture signal selection. The capture signal selection is defined by CxC bit. It is possible to select CxIFPx, CyIFPx or STCI as CxIN source. Of those, CyIFPx (x≠y) is the CyIFPy signal that is from Y channel and processed by channel-x edge detector (for example, C1IFP2 is the channel 1's C1IFP1 signal that passed through channel 2 edge detection). The STCI comes from slave timer controller, and its source is selected by STIS bit.
- CxIN outputs the CxIPS signal that is divided by input channel divider. The divider factor can be defined as No division, /2, /4 or /8, by the CxIDIV bit.

Figure 14-69 Input/output channel 1 main circuit

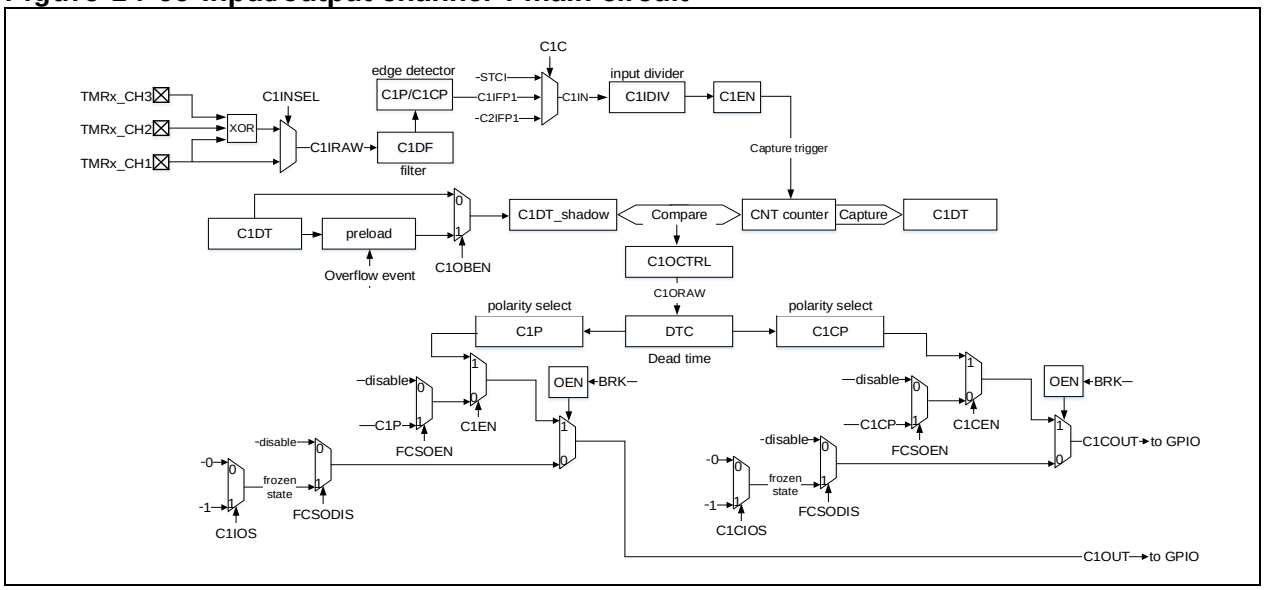


Figure 14-70 Channel 1 input stage

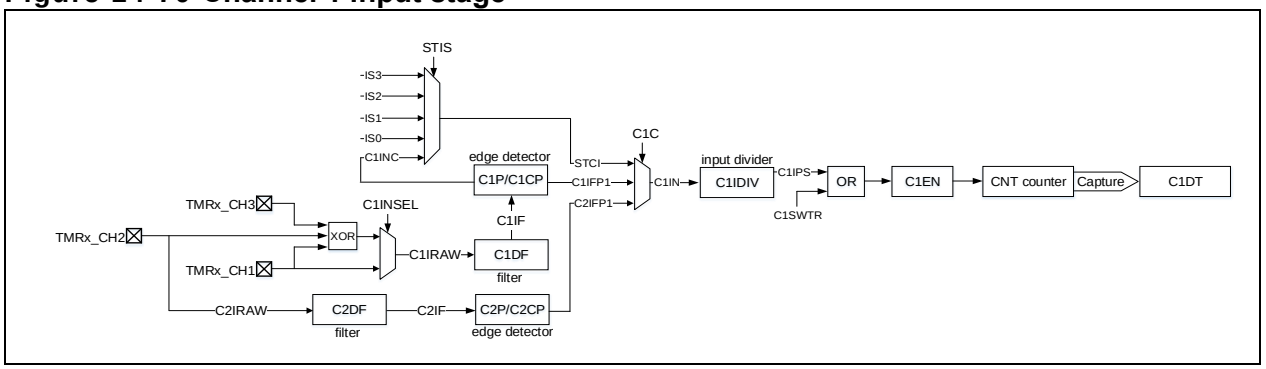

Input mode

In input mode, the TMRx_CxDT registers latch the current counter values after the selected triggle signal is detected, and the capture compare interrupt flag bit (CxIF) is set. An interrupt/DMA request will be generated if the CxIEN bit and CxDEN bit are enabled. If the selected trigger signal is detected when the CxIF is set to 1, a capture overflow event is generated. The previous counter value will be overwritten by the current counter value, with setting CxRF=1.

To capture the rising edge of C1IN input, following the configuration procedure mentioned below:

- Set C1C=01 in the TMRx_CM1 register to select the C1IN as channel 1 input
- Set the filter bandwidth of C1IN signal (CxDF[3: 0])
- Set the active edge on the C1IN channel by writing C1P=0 (rising edge) in the TMRx_CCTR register
- Program C1IN signal capture frequency divider (C1DIV[1: 0])
- Enable channel 1 input capture (C1EN=1)
- If needed, enable the relevant interrupt or DMA request by setting the C1IEN bit in the TMRx_IDEN register or the C1DEN bit in the TMRx_IDEN register

Timer Input XOR function

The timer input pins (TMRx_CH1, TMRx_CH2 and TMRx_CH3) are connected to the channel 1 (selected by setting the C1INSE in the TMRx_CTRL2 register) through an XOR gate.

The XOR gate can be used to connect Hall sensors. For example, connect the three XOR inputs to the three Hall sensors respectively so as to calculate the position and speed of the rotation by analyzing three Hall sensor signals.

PWM input

PWM input mode is applied to channel 1 and 2. To use this mode, both C1IN and C2IN are mapped on the same TMRx_CHx, and the CxIFPx of either channel 1 or channel 2 must be configured as trigger input and slave mode controller is configured in reset mode.

The PWM input mode can be used to measure the period and duty cycle of the PWM input signal. For example, the user can measure the period and duty cycle of the PWM applied on channel 1 using the following procedures:

- Set C1C=2‘b01: select C1IN for C1IFP1
- Set C1P=1’b0, select C1IFP1 rising edge active
- Set C2C=2‘b10, select C2IN for C1IFP2
- Set C2P=1’b1, select C1IFP2 falling edge active
- Set STIS=3’b101, select the slave mode timer trigger singal as C1IFP1
- Set SMSEL=3‘b100: configure the slave mode controller in reset mode
- Set C1EN=1’b1 and C2EN=1’b1. Enable channel 1 and input capture

After above configuration, the rising edge of channel 1 input signal will trigger the capture and stores the capture value into C1DT register, and it will reset the counter at the same time. The falling edge of the channel 1 input signal triggers the capture and stores the capture value into C2DT register. The period of the channel 1 input signal is calculated through C1DT, and its duty cycle through C2DT.

Figure 14-71 PWM input mode configuration example

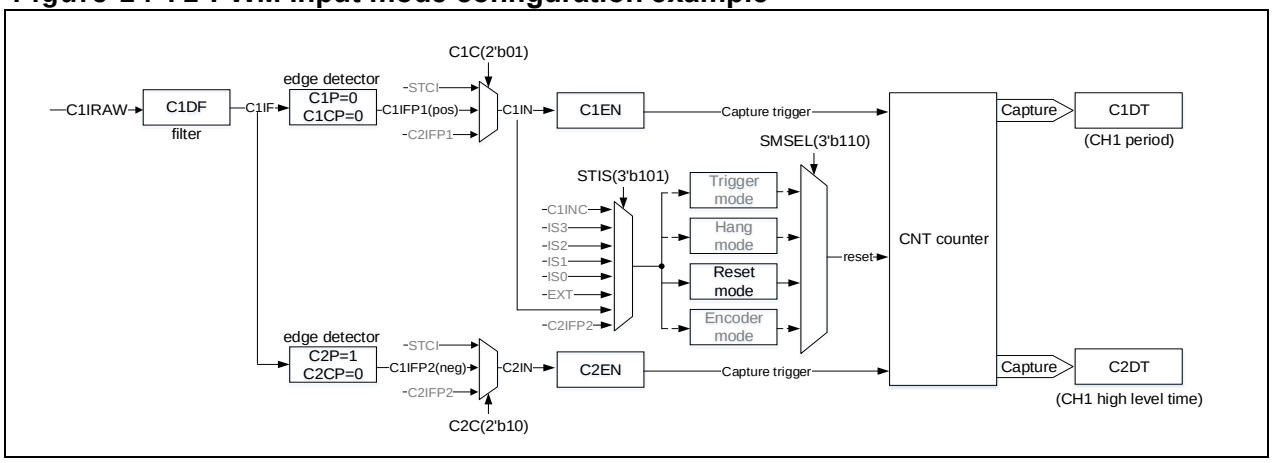

Figure 14-72 PWM input mode

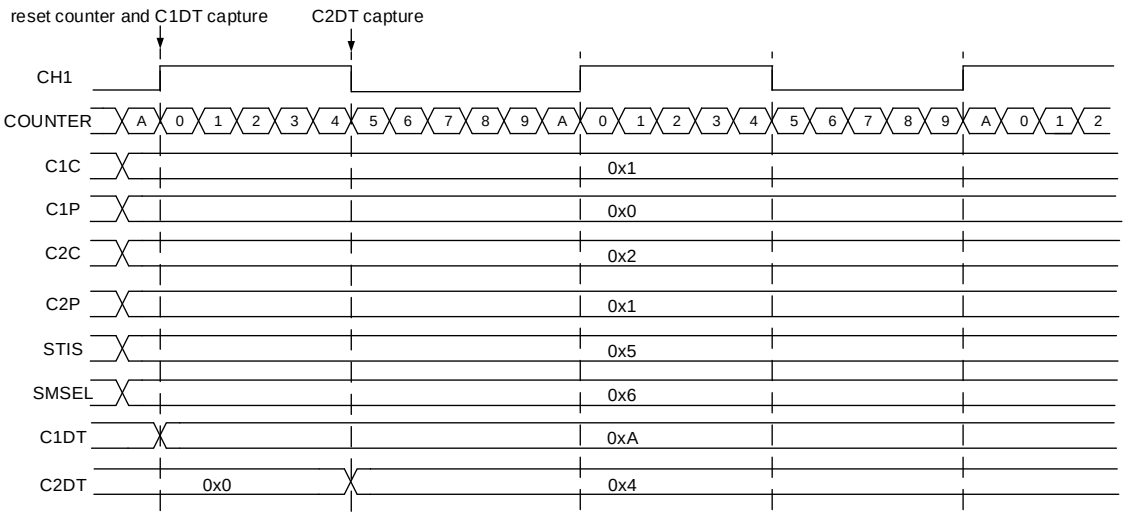

14.3.3.4 TMR output function

The TMR output consists of a comparator and an output controller. It is used to program the period, duty cycle and polarity of the output signal. The advanced-control timer output function varies from one channel to one channel.

Figure 14-73 Channel output stage (channel 1 to 3)

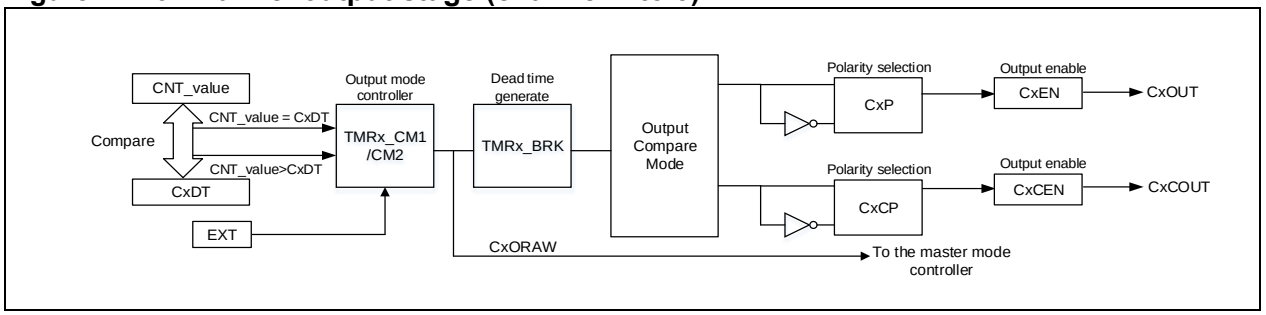

Figure 14-74 Channel 4 output stage

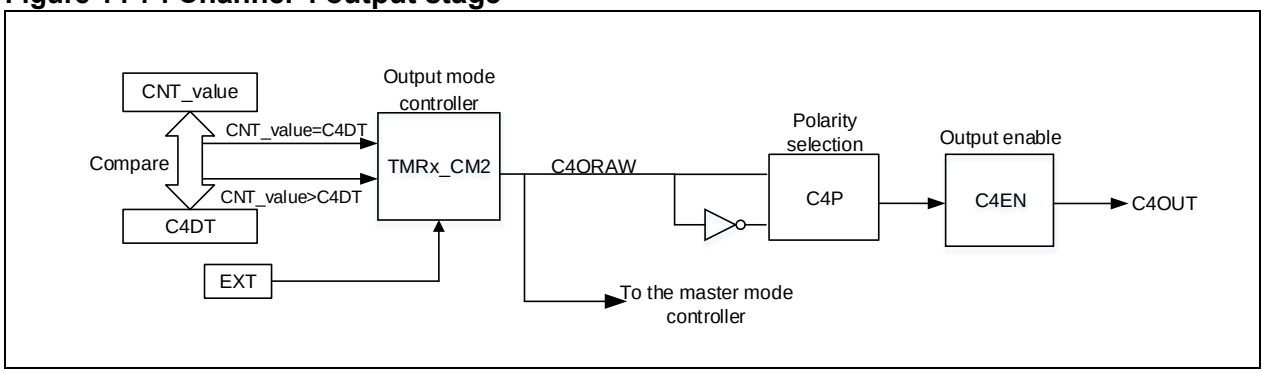

Output mode

Write CxC[1: 0]≠2'b00 to configure the channel as output to implement multiple output modes. In this case, the counter value is compared with the value in the TMRx_CxDT register, and the intermediate signal CxORAW is generated according to the output mode selected by CxOCTRL[2: 0], which is sent to IO after being processed by the output control circuit. The period of the output signal is configured by the TMRx_PR register, while the duty cycle by the TMRx_CxDT register.

Output compare modes include:

PWM mode A:

Enable PWM mode A by setting CxOCTRL=3'b110. In upcounting mode, C1ORAW outputs high when TMRx_C1DT>TMRx_CVAL, otherwise, it is low; In downcounting mode, C1ORAW outputs low when TMRx_C1DT<TMRx_CVAL, otherwise, it is high.

To use PWM mode A, the following procedures are recommended:

- Set PWM periods through TMRx_PR register
- Set PWM duty cycles through TMRx_CxDT register
- Select PWM mode A by setting CxOCTRL=3'b110 in the TMRx_CM1/CM2 register
- Set counting frequency through TMRx_DIV register
- Select counting mode by setting the TWCMSEL[1:0] bit in the TMRx_CTRL1 register
- Select output polarity through the CxP and CxCP bits in the TMRx_CCTRL register
- Enable channel output through the CxEN and CxCEN bits in the TMRx_CCTRL register
- Enable TMRx output through the OEN bit in the TMRx_BRK register
- Configure GPIOs corresponding to TMR output channels as multiplexed mode
- Enable TMRx to start counting through the TMREN bit in the TMRx_CTRL1 register.

PWM mode B:

Enable PWM mode B by setting CxOCTRL=3'b111. In upcounting mode, C1ORAW outputs low when

TMRx_C1DT>TMRx_CVAL, otherwise, it is high; In downcounting mode, C1ORAW outputs high when TMRx_C1DT<TMRx_CVAL, otherwise, it is low.

Forced output mode:

Enable forced output mode by setting CxOCTRL=3'b100/101. In this case, the CxORAW is forced to be the programmed level, regardless of the counter value. Despite this, the channel flag bit and DMA request still depend on the compare result.

Output compare mode:

Enable output compare mode by setting CxOCTRL=3'b001/010/011. In this case, when the counter value matches the value of the CxDT register, the CxORAW is forced high (CxOCTRL=3'b001), low (CxOCTRL=3'b010) or toggling (CxOCTRL=3'b011).

One-pulse mode:

This is a particular case of PWM mode. Enable one-pulse by setting OCMEN=1. In this mode, the comparison match is performed in the current counting period. The TMREN bit is cleared as soon as the current counting is completed. Therefore, only one pulse is output. When in upcounting mode, the configureation must follow the rule: CVAL<CxDT≤PR; in downcounting mode, CVAL>CxDT is required.

Fast output mode:

Enable this mode by setting CxOIEN=1. If enabled, the CxORAW signal will not change when the counter value matches the CxDT, but change at the beginning of the current counting period. In other words, the comparison result is advanced, so the comparison result between the counter value and the TMRx_CxDT register will determine the level of CxORAW in advance.

Figure 14-75 gives an example of output compare mode (toggle) with C1DT=0x3. When the counter value is equal to 0x3, C1OUT toggles.

Figure 14-76 gives an example of the combination between upcounting mode and PWM mode A. The output signal behaves when PR=0x32 but CxDT is configured with a different value.

Figure 14-77 gives an example of the combination between up/down counting mode and PWM mode A. The output signal behaves when PR=0x32 but CxDT is configured with a different value.

Figure 14-78 gives an example of the combination between upcounting mode and one-pulse PWM mode B. The counter only counts only one cycle, and the output signal sents only one pulse.

Figure 14-75 C1ORAW toggles when counter value matches the C1DT value

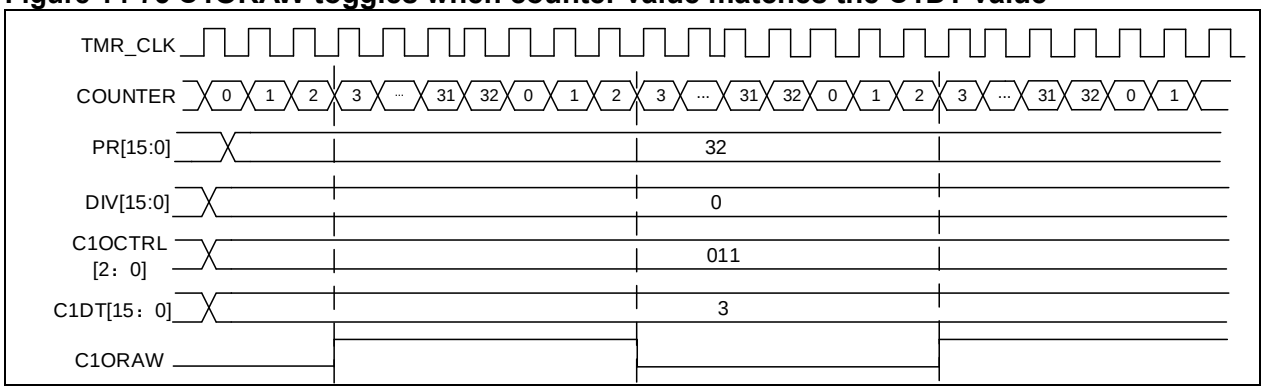

Figure 14-76 Upcounting mode and PWM mode A

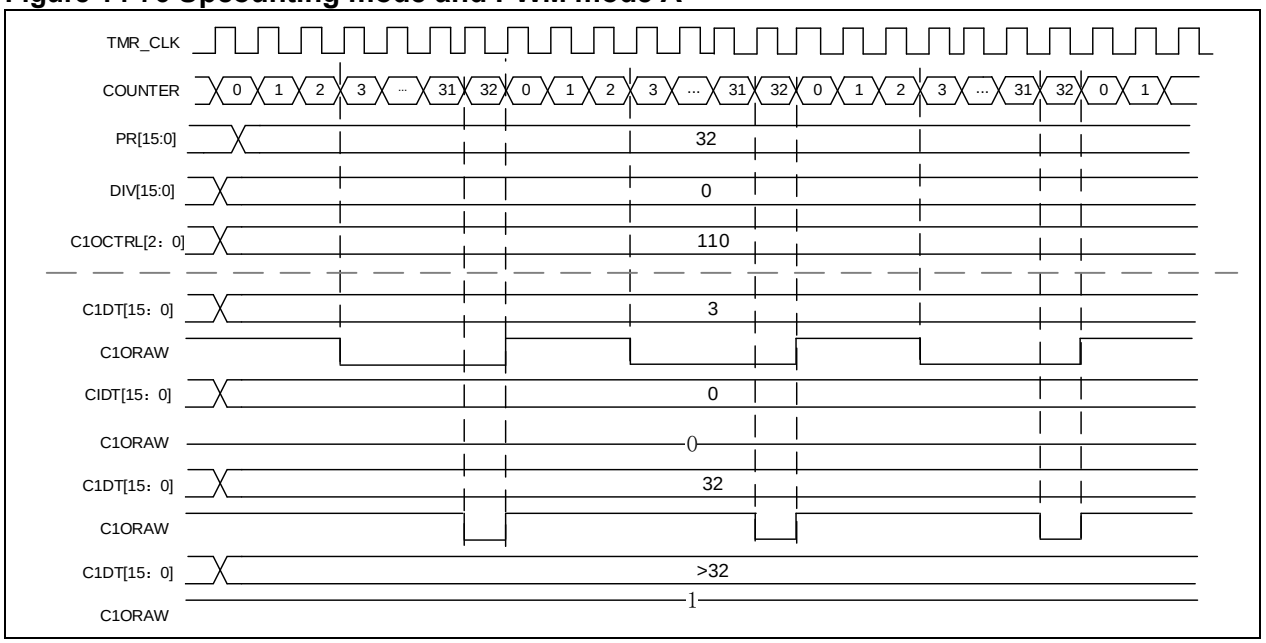

Figure 14-77 Up/down counting mode and PWM mode A

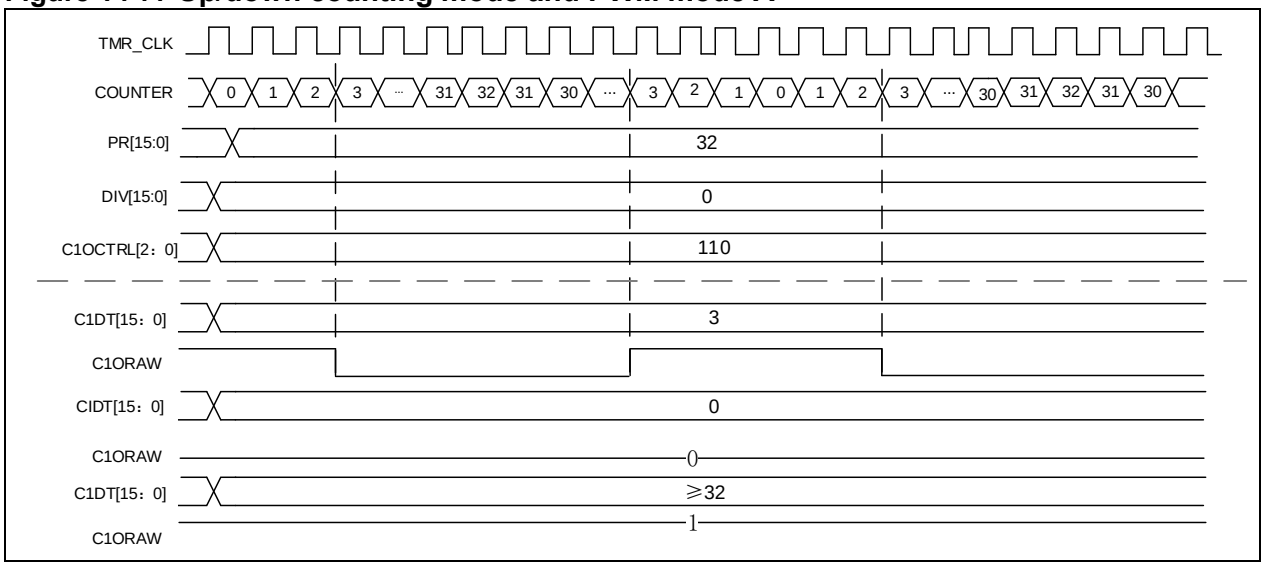

Figure 14-78 One-pulse mode

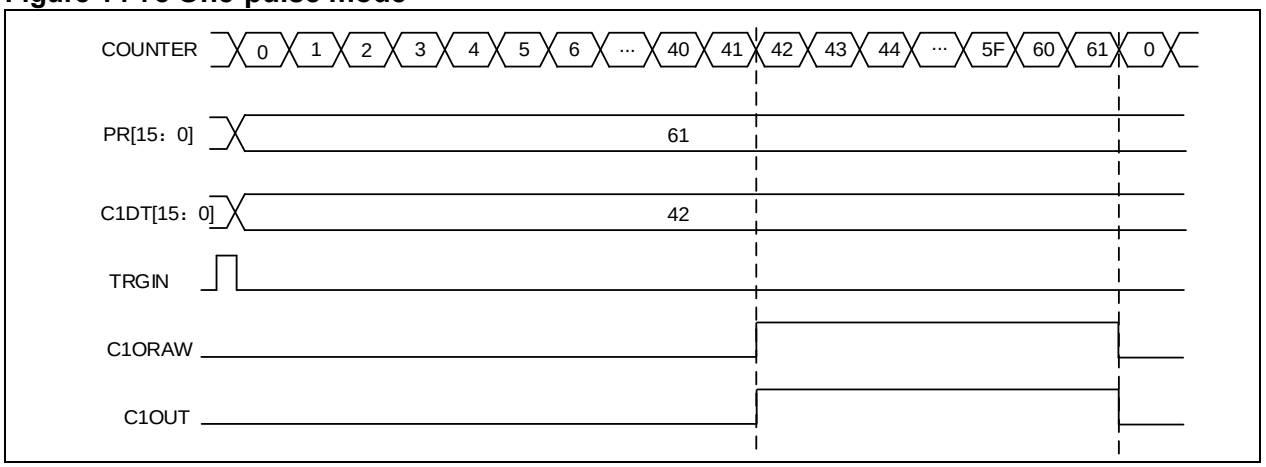


Master mode timer event output

When TMR is used as a master timer, one of the following source of sigals can be selected as TRGOUT output to a slave mode timer. This is done by setting the PTOS bit in the TMRxCTRL2 register.

-PTOS=3'b000, TRGOUT output software overflow event (OVFSWTR bit in TMRx_SWEVT register)

-PTOS=3'b001, TRGOUT output counter enable

-PTOS=3'b010, TRGOUT output counter overflow event

-PTOS=3'b011, TRGOUT output capture and compare event

-PTOS=3'b100, TRGOUT output C1ORAW

-PTOS=3'b101, TRGOUT output C2ORAW

-PTOS=3'b110, TRGOUT output C3ORAW

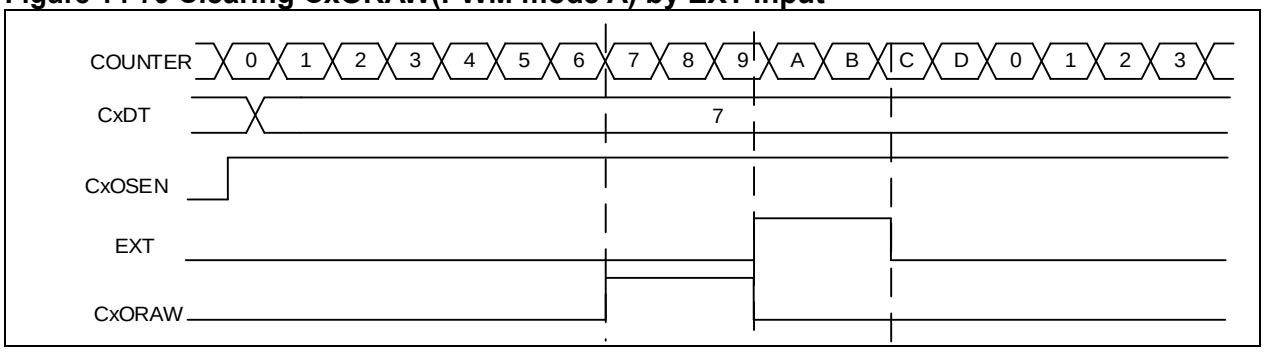
-PTOS=3'b111, TRGOUT output C4ORAW

CxORAW clear

When the CxOSEN bit is set, the CxORAW signal for a given channel is cleared by applying a high level to the EXT input. The CxORAW signal remains unchanged until the next overflow event.

This function can only be used in output capture or PWM modes, and does not work in forced mode. *Figure 14-79* shows the example of clearing CxORAW. When the EXT input is high, the CxORAW signal, which was originally high, is driven low; when the EXT is low, the CxORAW signal outputs the corresponding level according to the comparison result between the counter value and CxDT value.

Figure 14-79 Clearing CxORAW(PWM mode A) by EXT input



Dead-time insertion

The channel 1 to 3 of the advanced-control timers contains a set of reverse channel output. This function is enabled by the CxCEN bit and its polarity is defined by CxCP. Refer to *Table 14-14* for more information about the output state of CxOUT and CxCOUT.

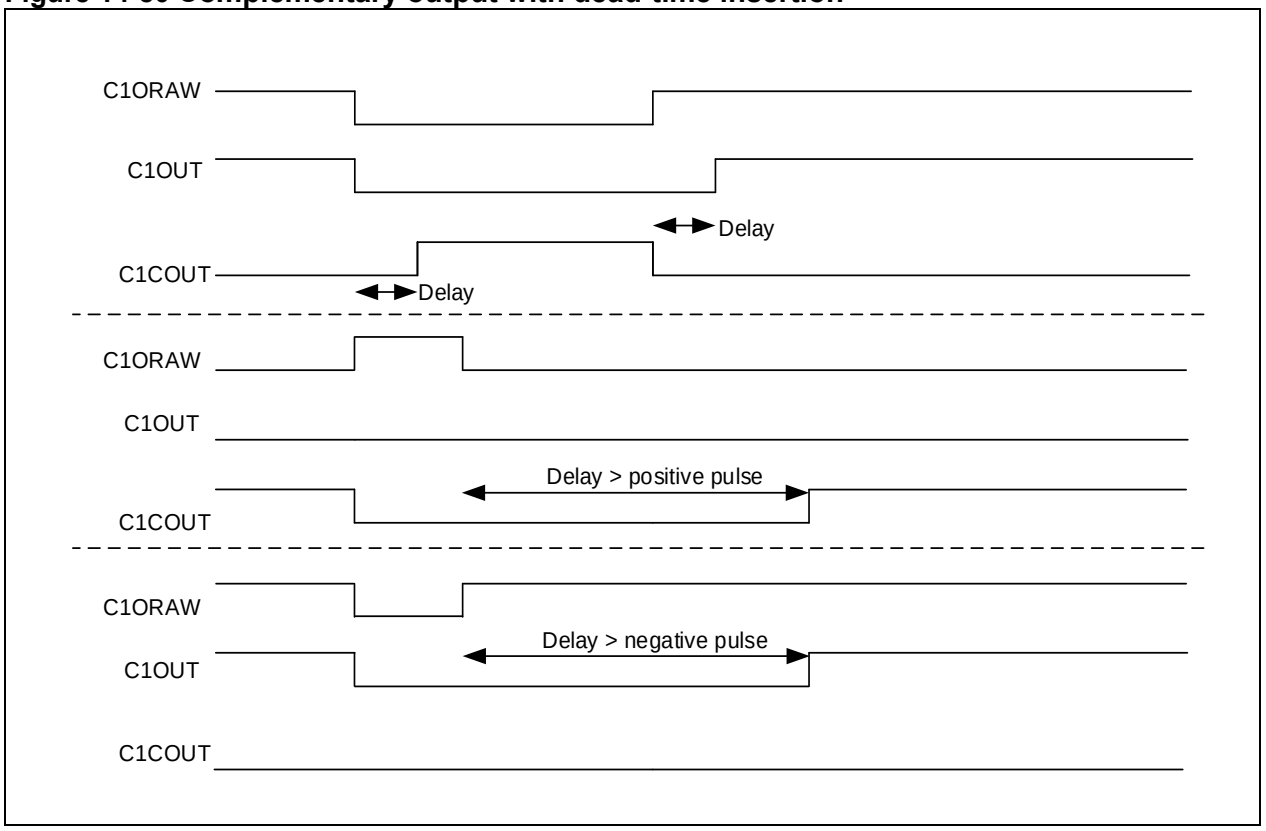
The dead-time is activated when switching to IDLEF state (OEN falling down to 0).

After setting both CxEN and CxCEN bits to 1, it is possible to insert dead-time of different durations using DTC[7:0] bit. After the dead-time insertion, the rising edge of the CxOUT is delayed compared to the rising edge of the reference signal; the rising edge of the CxCOU is delayed compared to the falling edge of the reference signal.

If the delay is greater than the width of the active output, C1OUT and C1COUT will not generate corresponding pulses. Therefore, the dead-time should be less than the width of the active output.

Figure 14-80 gives an example of dead-time insertion when CxP=0, CxCP=0, OEN=1, CxEN=1 and CxCEN=1.

Figure 14-80 Complementary output with dead-time insertion



14.3.3.5 TMR break function

When the break function is enabled (BRKEN=1), the CxOUT 和 CxCOUT are jointly controlled by OEN, FCSODIS, FCSOEN, CxIOS and CxCIOS. But, CxOUT and CxCOUT cannot be set both to active level at the same time. Please refer to *Table 14-14* for more details.

The break souce can be the break input pin or a clock failure event. The polarity is controlled by the BRKV bit.

When a break event occurs, there are the following actions:

- The OEN bit is cleared asynchronously, and the channel output state is selected by setting the FCSODIS bit. This function works even if the MCU oscillator is off.
- Once OEN=0, the channel output level is defined by the CxIOS bit. If FCSODIS=0, the timer output is disabled, otherwise, the output enable remains high.
- When complementary outputs are used:
  - The outputs are first put in reset state, that is, inactive state (depending on the polarity). This is done asynchronously so that it works even if no clock is provided to the timer.
  - If the timer clock is still active, then the dead-time generator is activated. The CxIOS and CxCIOS bits are used to program the level after dead-time. Even in this case, the CxIOS and CxCIOS cannot be driven to their actival level a the same time. It should be note that because of synchronization on OEN, the dead-time duration is usually longer than usual (around 2 clk_tmr clock cycles)
  - If FCSODIS=0, the timer releases the enable output, otherwise, it keeps the enable output; the enable output becomes high as soon as one of the CxEN and CxCEN bits becomes high.
- If the break interrupt or DMA request is enabled, the break statue flag is set, and a break interrupt or DMA request can be generated.
- If AOEN=1, the OEN bit is automatically set again at the next overflow event.

Note: When the break input is active, the OEN cannot be set, nor the status flag, BRKIF can be cleared.

Figure 14-81 TMR output control

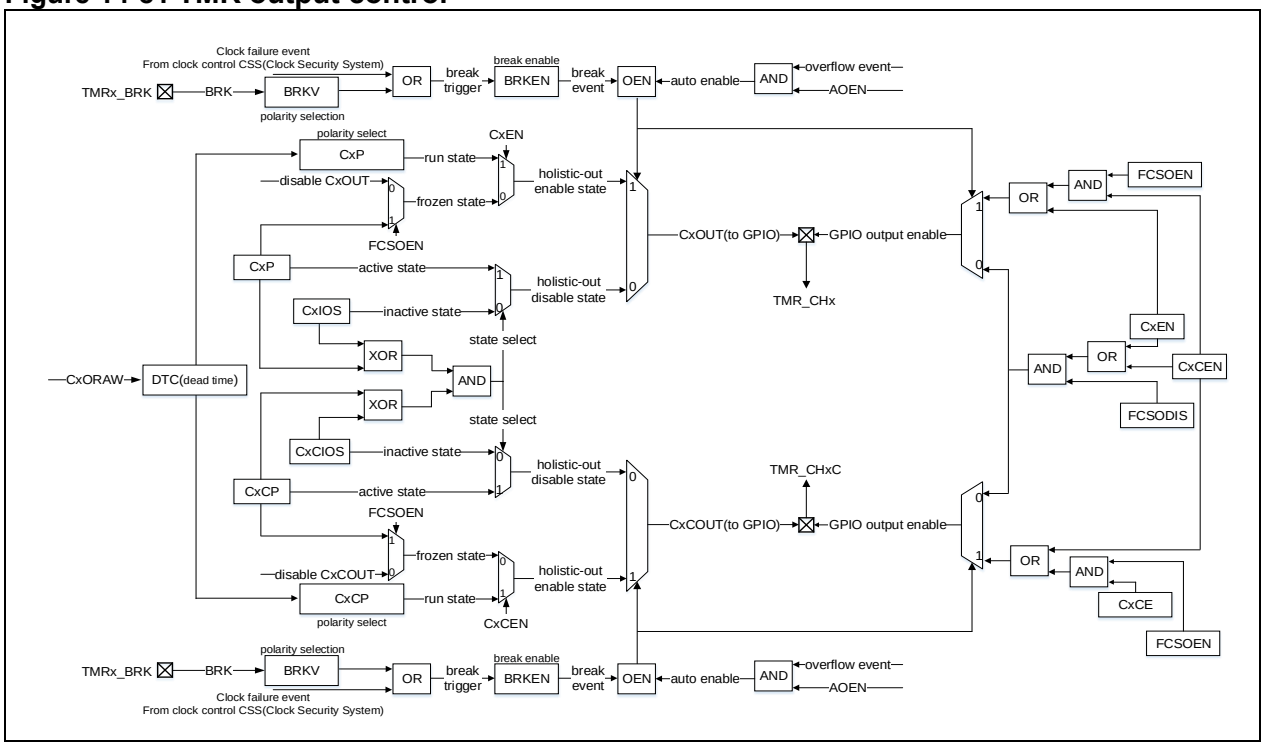


Figure 14-82 Example of TMR break function

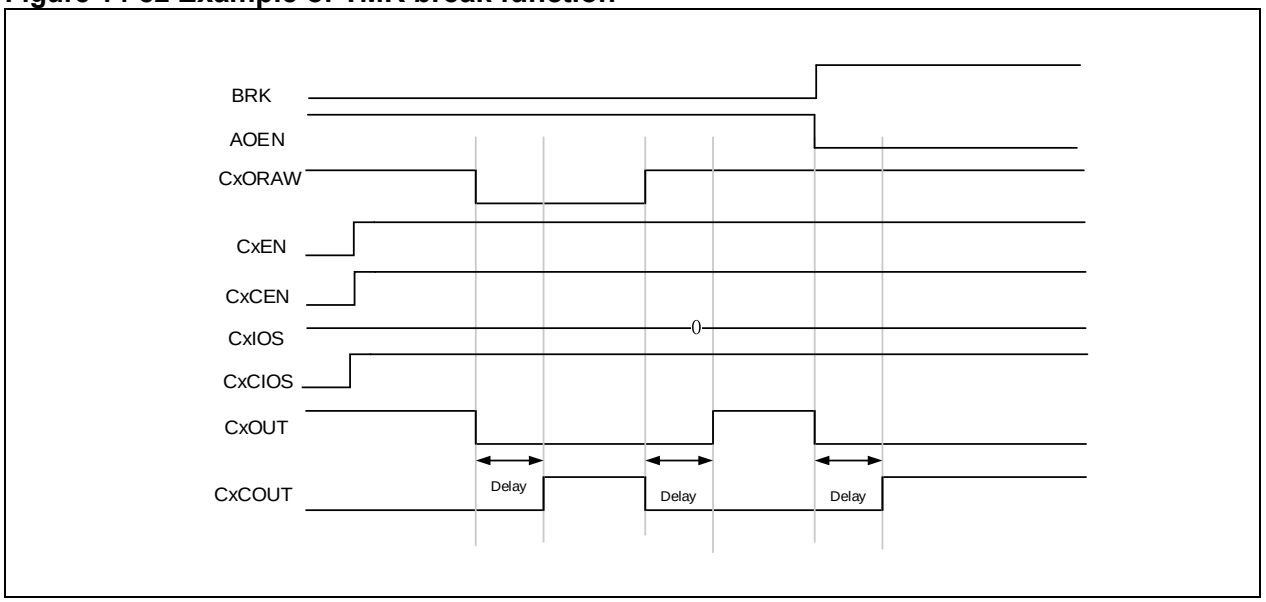


14.3.3.6 TMR synchronization

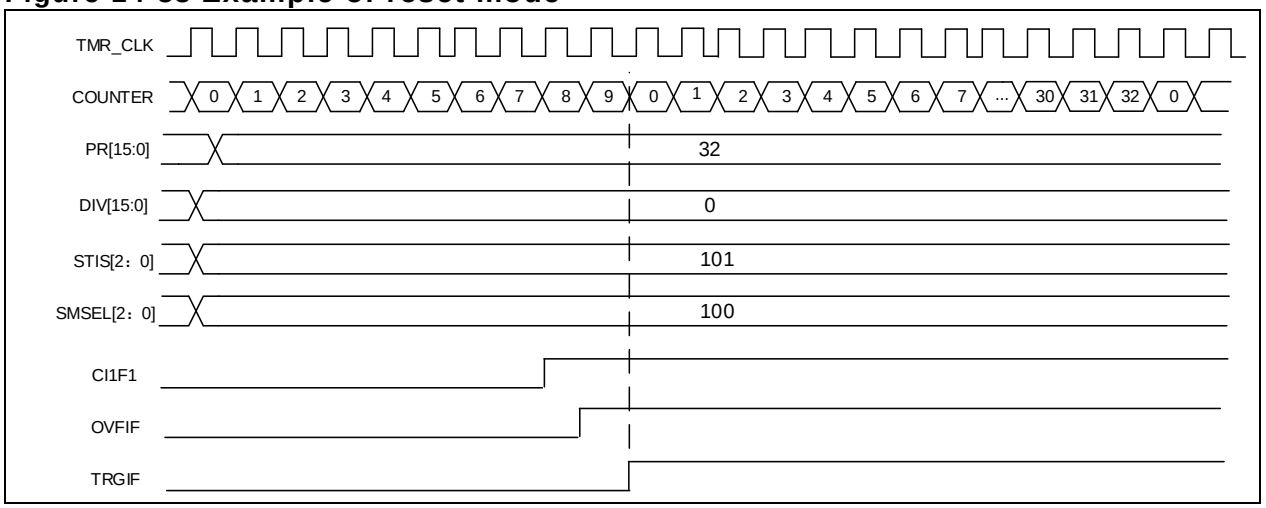
The timers are linked together internnaly for timer synchronization. Master timer is selected by setting the PTOS[2: 0] bit; Slave timer is selected by setting the SMSEL[2: 0] bit.

Slave modes include:

Slave mode: Reset mode

The counter and its prescaler can be reset by a selected trigger signal. An overflow event can be generated when OVFS=0.

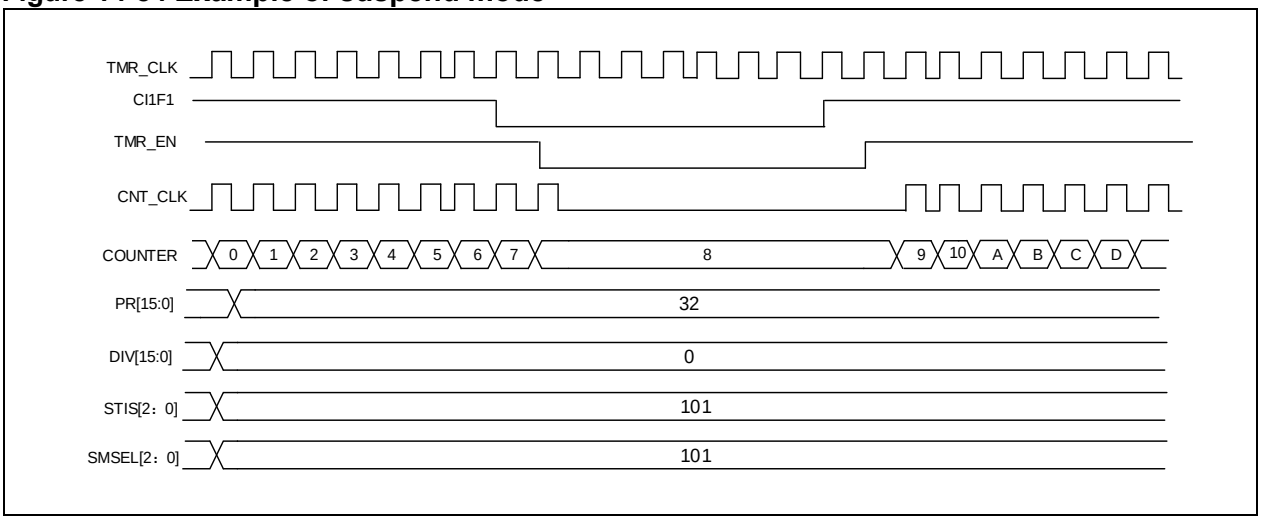
Figure 14-83 Example of reset mode



Slave mode: Suspend mode

In this mode, the counter is controlled by a selected trigger input. The counter starts counting when the trigger input is high and stops as soon as the trigger input is low.

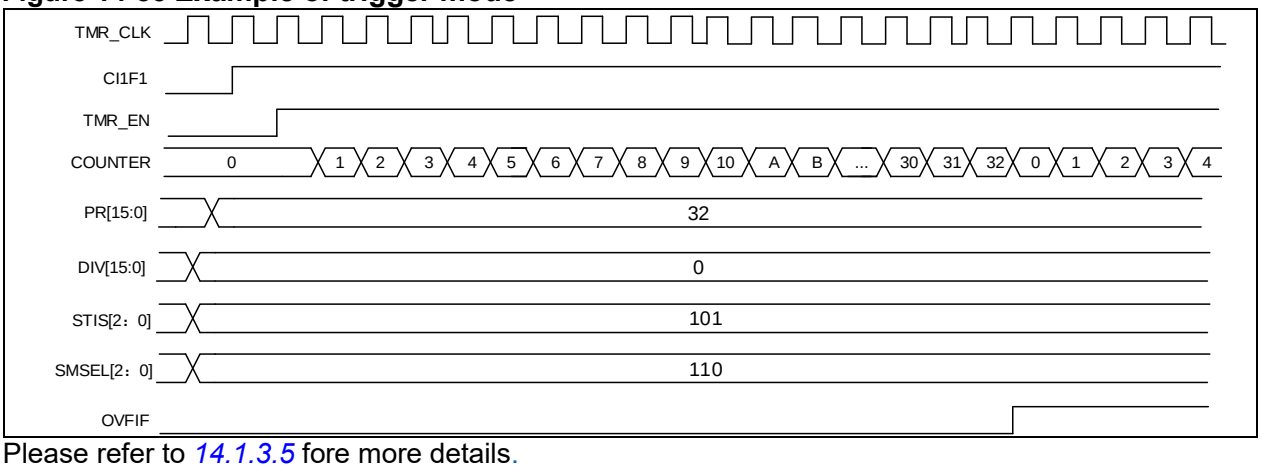
Figure 14-84 Example of suspend mode



Slave mode: Trigger mode

The counter can start counting on the rising edge of a selected trigger input (TMR_EN=1)

Figure 14-85 Example of trigger mode



Please refer to *14.1.3.5* fore more details.

14.3.3.7 Debug mode

When the microcontroller enters debug mode (Cortex®-M4F core halted), the TMRx counter stops counting by setting the TMRx_PAUSE in the DEBUG module.

14.3.4 TMR1 and TMR8 registers

These peripheral registers must be accessed by word (32 bits).

TMR1 and TMR8 registers are mapped into a 16-bit addressable space.

Table 14-13 TMR1 and TMR8 register map and reset value

Register	Offset	Reset value
TMRx_CTRL1	0x00	0x0000
TMRx_CTRL2	0x04	0x0000
TMRx_STCTRL	0x08	0x0000

14.3.4.1 TMR1 and TMR8 control register1 (TMRx_CTRL1)

Bit	Register	Reset value	Type	Description
Bit 15: 10	Reserved	0x00	resd	Kept at its default value.
Bit 9: 8	CLKDIV	0x0	rw	Clock division This field is used to define the relationship between digital filter sampling frequency (f_{DTS}) and timer clock frequency (f_{CK_INT}). it is also used to set the ratio relationship between dead time base (T_{DTS}) and timer clock period (T_{CK_INT}) 00: No division, $f_{DTS}=f_{CK\_INT}$ 01: Divided by 2, $f_{DTS}=f_{CK\_INT}/2$ 10: Divided by 4, $f_{DTS}=f_{CK\_INT}/4$ 11: Reserved
Bit 7	PRBEN	0x0	rw	Period buffer enable 0: Period buffer is disabled 1: Period buffer is enabled
Bit 6: 5	TWCMSEL	0x0	rw	Two-way counting mode selection 00: One-way counting mode, depending on the OWCDIR bit 01: Two-way counting mode1, count up and down alternately, the output flag bit is set only when the counter counts down 10: Two-way counting mode2, count up and down

				alternately, the output flag bit is set only when the counter counts up 11: Two-way counting mode3, count up and down alternately, the output flag bit is set when the counter counts up / down
Bit 4	OWCDIR	0x0	rw	One-way count direction 0: Up； 1: Down
Bit 3	OCMEN	0x0	rw	One cycle mode enable This bit is use to select whether to stop counting at an update event 0: The counter does not stop at an update event 1: The counter stops at an update event
Bit 2	OVFS	0x0	rw	Overflow event source This bit is used to select overflow event or DMA request sources. 0: Counter overflow, setting the OVFSWTR bit or overflow event generated by slave timer controller 1: Only counter overflow generates an overflow event
Bit 1	OVFEN	0x0	rw	Overflow event enable 0: Enabled 1: Disabled
Bit 0	TMREN	0x0	rw	TMR enable 0: Disabled 1: Enabled

14.3.4.2 TMR1 and TMR8 control register2 (TMRx_CTRL2)

Bit	Register	Reset value	Type	Description
Bit 15	Reserved	0x0	resd	Kept at its default value.
Bit 14	C4IOS	0x0	rw	Channel 4 idle output state
Bit 13	C3CIOS	0x0	rw	Channel 3 complementary idle output state
Bit 12	C3IOS	0x0	rw	Channel 3 idle output state
Bit 11	C2CIOS	0x0	rw	Channel 2 complementary idle output state
Bit 10	C2IOS	0x0	rw	Channel 2 idle output state
Bit 9	C1CIOS	0x0	rw	Channel 1 complementary idle output state OEN = 0 after dead-time: 0: C1OUTL=0 1: C1OUTL=1
Bit 8	C1IOS	0x0	rw	Channel 1 idle output state OEN = 0 after dead-time: 0: C1OUT=0 1: C1OUT=1
Bit 7	C1INSEL	0x0	rw	C1IN selection 0: CH1 pin is connected to C1IRAW input 1: The XOR result of CH1, CH2 and CH3 pins is connected to C1IRAW input
Bit 6: 4	PTOS	0x0	rw	Master TMR output selection This field is used to select the TMRx signal sent to the slave timer. 000: Reset 001: Enable 010: Update 011: Compare pulse 100: C1ORAW signal

				101: C2ORAW signal 110: C3ORAW signal 111: C4ORAW signal
Bit 3	DRS	0x0	rw	DMA request source 0: Capture/compare event 1: Overflow event
Bit 2	CCFS	0x0	rw	Channel control bit flash selection This bit only acts on channels that have complementaryoutput. If the channel contro bits are buffered: 0: Control bits are updated by setting the HALL bit 1: Control bits are updated by setting the HALL bit or a rising edge on TRGIN.
Bit 1	Reserved	0x0	resd	Kept at its default value.
Bit 0	CBCTRL	0x0	rw	Channel buffer control This bit acts on channels that have complementary output. 0: CxEN, CxCEN and CxOCTRL bits are not buffered. 1: CxEN, CxCEN and CxOCTRL bits are not buffered.

14.3.4.3 TMR1 and TMR8 slave timer control register (TMRx_STCTRL)

Bit	Register	Reset value	Type	Description
Bit 15	ESP	0x0	rw	External signal polarity 0: High or rising edge 1: Low or falling edge
Bit 14	ECMBEN	0x0	rw	External clock mode B enable This bit is used to enable external clock mode B 0: Disabled 1: Enabled
Bit 13: 12	ESDIV	0x0	rw	External signal divide This field is used to select the frequency division of an external trigger 00: Normal 01: Divided by 2 10: Divided by 4 11: Divided by 8
Bit 11: 8	ESF	0x0	rw	External signal filter This field is used to filter an external signal. The external signal can be sampled only after it has been generated N times 0000: No filter, sampling by f_{DTS} 0001: $f_{SAMPLING}$ =f_{CK_INT}, N=2 0010: $f_{SAMPLING}$ =f_{CK_INT}, N=4 0011: $f_{SAMPLING}$ =f_{CK_INT}, N=8 0100: $f_{SAMPLING}$ =f_{DTS}/2, N=6 0101: $f_{SAMPLING}$ =f_{DTS}/2, N=8 0110: $f_{SAMPLING}$ =f_{DTS}/4, N=6 0111: $f_{SAMPLING}$=f_{DTS}/4, N=8 1000: $f_{SAMPLING}$=f_{DTS}/8, N=6 1001: $f_{SAMPLING}$=f_{DTS}/8, N=8 1010: $f_{SAMPLING}$=f_{DTS}/16, N=5 1011: $f_{SAMPLING}$=f_{DTS}/16, N=6 1100: $f_{SAMPLING}$=f_{DTS}/16, N=8 1101: $f_{SAMPLING}$=f_{DTS}/32, N=5 1110: $f_{SAMPLING}$=f_{DTS}/32, N=6 1111: $f_{SAMPLING}$=f_{DTS}/32, N=8
Bit 7	STS	0x0	rw	Subordinate TMR synchronization If enabled, master and slave timer can be synchronized. 0: Disabled 1: Enabled
Bit 6: 4	STIS	0x0	rw	Subordinate TMR input selection This field is used to select the subordinate TMR input. 000: Internal selection 0 (IS0) 001: Internal selection 1 (IS1) 010: Internal selection 2 (IS2) 011: Internal selection 3 (IS3) 100: C1IRAW input detector (C1INC) 101: Filtered input 1 (C1IF1) 110: Filtered input 2 (C1IF2) 111: External input (EXT) Pleaser refer to Table 14-3 and 14-5 for more information on ISx for each timer.
Bit 3	Reserved	0x0	resd	Kept at its default value.

Bit 2: 0	SMSEL	0x0	rw	Subordinate TMR mode selection 000: Slave mode is disabled 001: Encoder mode A 010: Encoder mode B 011: Encoder mode C 100: Reset mode —Rising edge of the TRGIN input reinitializes the counter 101: Suspend mode — The counter starts counting when the TRGIN is high 110: Trigger mode — A trigger event is generated at the rising edge of the TRGIN input 111: External clock mode A — Rising edge of the TRGIN input clocks the counter Note: Please refer to count mode section for the details on encoder mode A/B/C.

14.3.4.4 TMR1 and TMR8 DMA/interrupt enable register (TMRx_IDEN)

Bit	Register	Reset value	Type	Description
Bit 15	Reserved	0x0	resd	Kept at its default value.
Bit 14	TDEN	0x0	rw	Trigger DMA request enable 0: Disabled 1: Enabled
Bit 13	HALLDE	0x0	rw	HALL DMA request enable 0: Disabled 1: Enabled
Bit 12	C4DEN	0x0	rw	Channel 4 DMA request enable 0: Disabled 1: Enabled
Bit 11	C3DEN	0x0	rw	Channel 3 DMA request enable 0: Disabled 1: Enabled。
Bit 10	C2DEN	0x0	rw	Channel 2 DMA request enable 0: Disabled 1: Enabled
Bit 9	C1DEN	0x0	rw	Channel 1 DMA request enable 0: Disabled 1: Enabled
Bit 8	OVFDEN	0x0	rw	Overflow event DMA request enable 0: Disabled 1: Enabled
Bit 7	BRKIE	0x0	rw	Break interrupt enable 0: Disabled 1: Enabled
Bit 6	TIEN	0x0	rw	Trigger interrupt enable 0: Disabled 1: Enabled
Bit 5	HALLIEN	0x0	rw	HALL interrupt enable 0: Disabled 1: Enabled
Bit 4	C4IEN	0x0	rw	Channel 4 interrupt enable 0: Disabled 1: Enabled
Bit 3	C3IEN	0x0	rw	Channel 3 interrupt enable

				0: Disabled 1: Enabled
Bit 2	C2IEN	0x0	rw	Channel 2 interrupt enable 0: Disabled 1: Enabled
Bit 1	C1IEN	0x0	rw	Channel 1 interrupt enable 0: Disabled 1: Enabled
Bit 0	OVFIEN	0x0	rw	Overflow interrupt enable 0: Disabled 1: Enabled

14.3.4.5 TMR1 and TMR8 interrupt status register (TMRx_ISTS)

Bit	Register	Reset value	Type	Description
Bit 15: 13	Reserved	0x0	resd	Kept at its default value.
Bit 12	C4RF	0x0	rw0c	Channel 4 recapture flag Please refer to C1RF description.
Bit 11	C3RF	0x0	rw0c	Channel 3 recapture flag Please refer to C1RF description.
Bit 10	C2RF	0x0	rw0c	Channel 2 recapture flag Please refer to C1RF description.
Bit 9	C1RF	0x0	rw0c	Channel 1 recapture flag This bit indicates whether a recapture is detected when C1IF=1. This bit is set by hardware, and cleared by writing “0”. 0: No capture is detected 1: Capture is detected.
Bit 8	Reserved	0x0	resd	Default value
Bit 7	BRKIF	0x0	rw0c	Break interrupt flag This bit indicates whether the break input is active or not. It is set by hardware and cleared by writing “0” 0: Inactive level 1: Active level
Bit 6	TRGIF	0x0	rw0c	Trigger interrupt flag This bit is set by hardware on a trigger event. It is cleard by writing “0”. 0: No trigger event occurs 1: Trigger event is generated. Trigger event: an active edge is detected on TRGIN input, or any edge in suspend mode.
Bit 5	HALLIF	0x0	rw0c	HALL interrupt flag This bit is set by hardware on HALL event. It is cleared by writing “0”. 0: No Hall event occurs. 1: Hall event is detected. HALL even: CxEN, CxCEN and CxOCTRL are updated.
Bit 4	C4IF	0x0	rw0c	Channel 4 interrupt flag Please refer to C1IF description.
Bit 3	C3IF	0x0	rw0c	Channel 3 interrupt flag Please refer to C1IF description.
Bit 2	C2IF	0x0	rw0c	Channel 2 interrupt flag Please refer to C1IF description.
Bit 1	C1IF	0x0	rw0c	Channel 1 interrupt flag If the channel 1 is configured as input mode:

				This bit is set by hardware on a capture event. It is cleared by software or read access to the TMRx_C1DT 0: No capture event occurs 1: Capture event is generated If the channel 1 is configured as output mode: This bit is set by hardware on a compare event. It is cleared by software. 0: No compare event occurs 1: Compare event is generated
Bit 0	OVFIF	0x0	rw0c	Overflow interrupt flag This bit is set by hardware on an overflow event. It is cleared by software. 0: No overflow event occurs 1: Overflow event is generated. If OVFEN=0 and OVFS=0 in the TMRx_CTRL1 register: − An overflow event is generated when OVFG= 1 in the TMRx_SWEVE register; − An overflow event is generated when the counter CVAL is reinitialized by a trigger event.

14.3.4.6 Software event register (TMRx_SWEVT)

Bit	Register	Reset value	Type	Description
Bit 15: 8	Reserved	0x000	resd	Kept at its default value.
Bit 7	BRKSWTR	0x0	wo	Break event triggered by software This bit is set by software to generate a break event. 0: No effect 1: Generate a break event.
Bit 6	TRGSWTR	0x0	rw	Trigger event triggered by software This bit is set by software to generate a trigger event. 0: No effect 1: Generate a trigger event.
Bit 5	HALLSWTR	0x0	wo	HALL event triggered by software This bit is set by software to generate a HALL event. 0: No effect 1: Generate a HALL event. Note: This bit acts only on channels that have complementary output.
Bit 4	C4SWTR	0x0	wo	Channel 4 event triggered by software Please refer to C1M description.
Bit 3	C3SWTR	0x0	wo	Channel 3 event triggered by software Please refer to C1M description.
Bit 2	C2SWTR	0x0	wo	Channel 2 event triggered by software Please refer to C1M description
Bit 1	C1SWTR	0x0	wo	Channel 1 event triggered by software This bit is set by software to generate a channel 1 event. 0: No effect 1: Generate a channel 1 event.
Bit 0	OVFSWTR	0x0	wo	Overflow event triggered by software This bit is set by software to generate an overflow event. 0: No effect 1: Generate an overflow event.

14.3.4.7 TMR1 and TMR8 channel mode register1 (TMRx_CM1)

The channel can be used in input (capture mode) or output (compare mode). The direction of a channel is defined by the corresponding CxC bits. All the other bits of this register have different functons in input and output modes. The CxOx describes its function in output mode when the channel is in output mode, while the CxIx describes its function in output mode when the channel is in input mode. Attention must be given to the fact that the same bit can have different functions in input mode and output mode.

Output compare mode:

Bit	Register	Reset value	Type	Description
Bit 15	C2OSEN	0x0	rw	Channel 2 output switch enable
Bit 14: 12	C2OCTRL	0x0	rw	Channel 2 output control
Bit 11	C2OBEN	0x0	rw	Channel 2 output buffer enable
Bit 10	C2OIEN	0x0	rw	Channel 2 output enable immediately
Bit 9: 8	C2C	0x0	rw	Channel 2 configuration This field is used to define the direction of the channel 2 (input or output), and the selection of input pin when C2EN='0': 00: Output 01: Input,， C2IN is mapped on C2IFP2 10: Input, C2IN is mapped on C1IFP2 11: Input, C2IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS register.
Bit 7	C1OSEN	0x0	rw	Channel 1 output switch enable 0: C1ORAW is not affected by EXT input. 1: Once a high level is detect on EXT input, clear C1ORAW.
Bit 6: 4	C1OCTRL	0x0	rw	Channel 1 output control This field defines the behavior of the original signal C1ORAW. 000: Disconnected. C1ORAW is disconnected from C1OUT; 001: C1ORAW is high when TMRx_CVAL=TMRx_C1DT 010: C1ORAW is low when TMRx_CVAL=TMRx_C1DT 011: Switch C1ORAW level when TMRx_CVAL=TMRx_C1DT 100: C1ORAW is forced low 101: C1ORAW is forced high. 110: PWM mode A －OWCDIR=0, C1ORAW is high once TMRx_C1DT>TMRx_CVAL, else low; －OWCDIR=1, C1ORAW is low once TMRx_ C1DT <TMRx_CVAL, else high; 111: PWM mode B － OWCDIR=0, C1ORAW is low once TMRx_ C1DT >TMRx_CVAL, else high; － OWCDIR=1, C1ORAW is high once TMRx_ C1DT <TMRx_CVAL, else low. *Note: In the configurations othern than 000', the C1OUT is connected to C1ORAW. The C1OUT output level is not only subject to the changes of C1ORAW, but also the output polarity set by CCTRL.*
Bit 3	C1OBEN	0x0	rw	Channel 1 output buffer enable 0: Buffer function of TMRx_C1DT is disabled. The new value written to the TMRx_C1DT takes effect immediately.

				1: Buffer function of TMRx_C1DT is enabled. The value to be written to the TMRx_C1DT is stored in the buffer register, and can be sent to the TMRx_C1DT register only on an overflow event.
Bit 2	C1OIEN	0x0	rw	Channel 1 output enable immediately In PWM mode A or B, this bit is used to accelerate the channel 1 output's response to the trigger event. 0: Need to compare the CVAL with C1DT before generating an output 1: No need to compare the CVAL and C1DT. An output is generated immediately when a trigger event occurs.
Bit 1: 0	C1C	0x0	rw	Channel 1 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C1EN='0': 00: Output 01: Input, C1IN is mapped on C1IFP1 10: Input, C1IN is mapped on C2IFP1 11: Input, C1IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

Input capture mode:

Bit	Register	Reset value	Type	Description
Bit 15: 12	C2DF	0x0	rw	Channel 2 digital filter
Bit 11: 10	C2IDIV	0x0	rw	Channel 2 input divider
Bit 9: 8	C2C	0x0	rw	Channel 2 configuration This field is used to define the direction of the channel 2 (input or output), and the selection of input pin when C2EN='0': 00: Output 01: Input, C2IN is mapped on C2IFP2 10: Input, C2IN is mapped on C1IFP2 11: Input, C2IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.
Bit 7: 4	C1DF	0x0	rw	Channel 1 digital filter This field defines the digital filter of the channel 1. N stands for the number of filtering, indicating that the input edge can pass the filter only after N sampling events. 0000: No filter, sampling is done at f_{DTS} 1000: $f_{SAMPLING}=f_{DTS}/8$, N=6 0001: $f_{SAMPLING}=f_{CK\_INT}$, N=2 1001: $f_{SAMPLING}=f_{DTS}/8$, N=8 0010: $f_{SAMPLING}=f_{CK\_INT}$, N=4 1010: $f_{SAMPLING}=f_{DTS}/16$, N=5 0011: $f_{SAMPLING}=f_{CK\_INT}$, N=8 1011: $f_{SAMPLING}=f_{DTS}/16$, N=6 0100: $f_{SAMPLING}=f_{DTS}/2$, N=6 1100: $f_{SAMPLING}=f_{DTS}/16$, N=8 0101: $f_{SAMPLING}=f_{DTS}/2$, N=8 1101: $f_{SAMPLING}=f_{DTS}/32$, N=5 0110: $f_{SMPLING}=f_{DTS}/4$, N=6 1110: $f_{SAMPLING}=f_{DTS}/32$, N=6 0111: $f_{SAMPLING}=f_{DTS}/4$, N=8 1111: $f_{SAMPLING}=f_{DTS}/32$, N=8
Bit 3: 2	C1IDIV	0x0	rw	Channel 1 input divider This field defines Channel 1 input divider.

				00: No divider. An input capture is generated at each active edge. 01: An input compare is generated every 2 active edges 10: An input compare is generated every 4 active edges 11: An input compare is generated every 8 active edges Note: the divider is reset once C1EN='0'
Bit 1: 0	C1C	0x0	rw	Channel 1 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C1EN='0': 00: Output 01: Input, C1IN is mapped on C1IFP1 10: Input, C1IN is mapped on C2IFP1 11: Input, C1IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

14.3.4.8 Channel mode register2 (TMRx_CM2)

The channel can be used in input (capture mode) or output (compare mode). The direction of a channel is defined by the corresponding CxC bits. All the other bits of this register have different functons in input and output modes. The CxOx describes its function in output mode when the channel is in output mode, while the CxIx describes its function in output mode when the channel is in input mode. Attention must be given to the fact that the same bit can have different functions in input mode and output mode.

Output compare mode:

Bit	Register	Reset value	Type	Description
Bit 15	C4OSEN	0x0	rw	Channel 4 output switch enable
Bit 14: 12	C4OCTRL	0x0	rw	Channel 4 output control
Bit 11	C4OBEN	0x0	rw	Channel 4 output buffer enable
Bit 10	C4OIEN	0x0	rw	Channel 4 output enable immediately
Bit 9: 8	C4C	0x0	rw	Channel 4 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C4EN='0': 00: Output 01: Input, C4IN is mapped on C4IFP4 10: Input, C4IN is mapped on C3IFP4 11: Input, C4IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.
Bit 7	C3OSEN	0x0	rw	Channel 3 output switch enable
Bit 6: 4	C3OCTRL	0x0	rw	Channel 3 output control
Bit 3	C3OBEN	0x0	rw	Channel 3 output buffer enable
Bit 2	C3OIEN	0x0	rw	Channel 3 output enable immediately
Bit 1: 0	C3C	0x0	rw	Channel 3 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C3EN='0': 00: Output 01: Input, C3IN is mapped on C3IFP3 10: Input, C3IN is mapped on C4IFP3 11: Input, C3IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

Input capture mode:

Bit	Register	Reset value	Type	Description
Bit 15: 12	C4DF	0x0	rw	Channel 4 digital filter
Bit 11: 10	C4IDIV	0x0	rw	Channel 4 input divider
Bit 9: 8	C4C	0x0	rw	Channel 4 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C4EN='0': 00: Output 01: Input, C4IN is mapped on C4IFP4 10: Input, C4IN is mapped on C3IFP4 11: Input, C4IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.
Bit 7: 4	C3DF	0x0	rw	Channel 3 digital filter
Bit 3: 2	C3IDIV	0x0	rw	Channel 3 input divider
Bit 1:0	C3C	0x0	rw	Channel 3 configuration This field is used to define the direction of the channel 1 (input or output), and the selection of input pin when C3EN='0': 00: Output 01: Input, C3IN is mapped on C3IFP3 10: Input, C3IN is mapped on C4IFP3 11: Input, C3IN is mapped on STCI. This mode works only when the internal trigger input is selected by STIS.

14.3.4.9 Channel control register (TMRx_CCTRL)

Bit	Register	Reset value	Type	Description
Bit 15: 14	Reserved	0x0	resd	Kept its default value.
Bit 13	C4P	0x0	rw	Channel 4 polarity Pleaser refer to C1P description.
Bit 12	C4EN	0x0	rw	Channel 4 enable Pleaser refer to C1EN description.
Bit 11	C3CP	0x0	rw	Channel 3 complementary polarity Please refer to C1P description.
Bit 10	C3CEN	0x0	rw	Channel 3 complementary enable Please refer to C1EN description.
Bit 9	C3P	0x0	rw	Channel 3 polarity Pleaser refer to C1P description.
Bit 8	C3EN	0x0	rw	Channel 3 enable Pleaser refer to C1EN description.
Bit 7	C2CP	0x0	rw	Channel 2 complementary polarity Please refer to C1P description.
Bit 6	C2CEN	0x0	rw	Channel 2 complementary enable Please refer to C1EN description.
Bit 5	C2P	0x0	rw	Channel 2 polarity Pleaser refer to C1P description.
Bit 4	C2EN	0x0	rw	Channel 2 enable Pleaser refer to C1EN description.
Bit 3	C1CP	0x0	rw	Channel 1 complementary polarity 0: C1COUT is active high. 1: C1COUT is active low.
Bit 2	C1CEN	0x0	rw	Channel 1 complementary enable 0: Output is disabled. 1: Output is enabled.

Bit 1	C1P	0x0	rw	Channel 1 polarity When the channel 1 is configured as output mode: 0: C1OUT is active high 1: C1OUT is active low When the channel 1 is configured as input mode: 0: C1IN active edge is on its rising edge. When used as external trigger, C1IN is not inverted. 1: C1IN active edge is on its falling edge. When used as external trigger, C1IN is inverted.
Bit0	C1EN	0x0	rw	Channel 1 enable 0: Input or output is disabled 1: Input or output is enabled

Table 14-14 Complementary output channel CxOUT and CxCOUT control bits with break function

Control bit					Output state (1)	
OEN bit	FCSODIS bit	FCSOEN bit	CxEN bit	CxCEN bit	CxOUT output state	CxCOUT output state
1	X	0	0	0	Output disabled (no driven by the timer) CxOUT=0, Cx_EN=0	Output disabled (no driven by the timer) CxCOUT=0, CxCEN=0
		0	0	1	Output disabled (no driven by the timer) CxOUT=0, Cx_EN=0	CxORAW + polarity, CxCOUT= CxORAW xor CxCP, CxCEN=1
		0	1	0	CxORAW+ polarity CxOUT= CxORAW xor CxP, Cx_EN=1	Output disabled (no driven by the timer) CxCOUT=0, CxCEN=0
		0	1	1	CxORAW+polarity+dead-time, Cx_EN=1	CxORAW inverted+polarity+dead-time, CxCEN=1
		1	0	0	Output disabled (no driven by the timer) CxOUT=CxP, Cx_EN=0	Output disabled (no driven by the timer) CxCOUT=CxCP, CxCEN=0
		1	0	1	Off-state (Output enabled with inactive level) CxOUT=CxP, Cx_EN=1	CxORAW + polarity, CxCOUT= CxORAW xor CxCP, CxCEN=1
		1	1	0	CxORAW + polarity, CxOUT= CxORAW xor CxP, Cx_EN=1	Off-state (Output enabled with inactive level) CxCOUT=CxCP, CxCEN=1
		1	1	1	CxORAW+ polarity+dead-time, Cx_EN=1	CxORAW inverted+polarity+dead-time, CxCEN=1
0	0	X	0	0	Output disabled (no driven by the timer) Asynchronously: CxOUT=CxP, Cx_EN=0, CxCOUT=CxCP, CxCEN=0; If the clock is present: after a dead-time, CxOUT=CxIOS，CxCOUT=CxCIOS, assuming that CxIOS and CxCIOS do not correspond to CxOUT and CxCOUT active level.	
	0		0	1		
	0		1	0		
	0		1	1		
	1		0	0	Off-state (Output enabled with inactive level) Asynchronously: CxOUT =CxP, Cx_EN=1, CxCOUT=CxCP, CxCEN=1;	
	1		0	1		

Control bit					Output state (1)
	1		1	0	If the clock is present: after a dead-time, CxOUT=CxIOS，CxCOUT=CxCIOS, assuming that CxIOS and CxCIOS do not correspond to CxOUT and CxCOUT active level.
	1		1	1	

Note: If the two outputs of a channel are not used (CxEN = CxCEN = 0), CxIOS, CxCIOS, CxP and CxCP must be cleared.

Note: The state of the external I/O pins connected to the complementary CxOUT and CxCOUT channels depends on the CxOUT and CxCOUT channel state and the GPIO and the IOMUX registers.

14.3.4.10 TMR1 and TMR8 counter value (TMRx_CVAL)

Bit	Register	Reset value	Type	Description
Bit 15: 0	CVAL	0x0000	rw	Counter value

14.3.4.11 TMR1 and TMR8 division value (TMRx_DIV)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DIV	0x0000	rw	Divider value The counter clock frequency $f_{CK\_CNT} = f_{TMR\_CLK}$ / (DIV[15: 0]+1). The value of this register is transferred to the actual prescaler register when an overflow event occurs.

14.3.4.12 TMR1 and TMR8 period register (TMRx_PR)

Bit	Register	Reset value	Type	Description
Bit 15: 0	PR	0x0000	rw	Period value This defines the period value of the TMRx counter. The timer stops working when the period value is 0.

14.3.4.13 TMR1 and TMR8 repetition period register (TMRx_RPR)

Bit	Register	Reset value	Type	Description
Bit 15: 8	Reserved	0x00	resd	Kept at its default value.
Bit 7: 0	RPR	0x00	rw	Repetition of period value This field is used to reduce the generation rate of overflow events. An overflow event is generated when the repetition counter reaches 0.

14.3.4.14 TMR1 and TMR8 channel 1 data register (TMRx_C1DT)

Bit	Register	Reset value	Type	Description
Bit 15: 0	C1DT	0x0000	rw	Channel 1 data register When the channel 1 is configured as input mode: The C1DT is the CVAL value stored by the last channel 1 input event (C1IN) When the channel 1 is configured as output mode: C1DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C1OBEN bit, and the corresponding output is generated on C1OUT as configured.

14.3.4.15 TMR1 and TMR8 channel 2 data register (TMRx_C2DT)

Bit	Register	Reset value	Type	Description
Bit 15: 0	C2DT	0x0000	rw	Channel 2 data register When the channel 2 is configured as input mode: The C2DT is the CVAL value stored by the last channel 2 input event (C1IN) When the channel 2 is configured as output mode: C2DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C2OBEN bit, and the corresponding output is generated on C2OUT as configured.

14.3.4.16 TMR1 and TMR8 channel 3 data register (TMRx_C3DT)

Bit	Register	Reset value	Type	Description
Bit 15: 0	C3DT	0x0000	rw	Channel 3 data register When the channel 3 is configured as input mode: The C3DT is the CVAL value stored by the last channel 3 input event (C1IN) When the channel 3 is configured as output mode: C3DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C3OBEN bit, and the corresponding output is generated on C3OUT as configured.

14.3.4.17 TMR1 and TMR8 channel 4 data register (TMRx_C4DT)

Bit	Register	Reset value	Type	Description
Bit 15: 0	C3DT	0x0000	rw	Channel 4 data register When the channel 4 is configured as input mode: The C4DT is the CVAL value stored by the last channel 4 input event (C1IN) When the channel 3 is configured as output mode: C4DT is the value to be compared with the CVAL value. Whether the written value takes effective immediately depends on the C4OBEN bit, and the corresponding output is generated on C4OUT as configured.

14.3.4.18 TMR1 and TMR8 break register (TMRx_BRK)

Bit	Register	Reset value	Type	Description
Bit 15	OEN	0x0	rw	Output enable This bit acts on the channels as output. It is used to enable CxOUT and CxCOUT outputs. 0: Disabled 1: Enabled
Bit 14	AOEN	0x0	rw	Automatic output enable OEN is set automatically at an overflow event. 0: Disabled 1: Enabled
Bit 13	BRKV	0x0	rw	Break input validity This bit is used to select the active level of a break input. 0: Break input is active low. 1 Break input is active high.
Bit 12	BRKEN	0x0	rw	Break enable This bit is used to enable break input. 0: Break input is disabled. 1: Break input is enabled.

Bit 11	FCSOEN	0x0	rw	Frozen channel status when holistic output enable This bit acts on the channels that have complementary output. It is used to set the channel state when the timer is inactive and OEN=1. 0: CxOUT/CxCOUT outputs are disabled. 1: CxOUT/CxCOUT outputs are enabled. Output inactive level.
Bit 10	FCSODIS	0x0	rw	Frozen channel status when holistic output disable This bit acts on the channels that have complementary output. It is used to set the channel state when the timer is inactive and OEN=0. 0: CxOUT/CxCOUT outputs are disabled. 1: CxOUT/CxCOUT outputs are enabled. Output idle level.
Bit 9: 8	WPC	0x0	rw	Write protection configuration his field is used to enable write protection. 00: Write protection is OFF. 01: Write protection level 3, and the following bits are write protected: TMRx_BRK: DTC, BRKEN, BRKV and AOEN TMRx_CTRL2: CxIOS and CxCIOS 10: Write protection level 2. The following bits and all bits in leve 3 are write protected: TMRx_CCTRL: CxP and CxCP TMRx_BRK: FCSODIS and FCSOEN 11: Write protection level 1. The following bits and all bits in level 2 are write protected: TMRx_CMx: C2OCTRL and C2OBEN Note: Once WPC>0, its content remains frozen until the next system reset.
Bit 7: 0	DTC	0x00	rw	Dead-time configuration This field defines the duration of the dead-time insertation. The 3-bit MSB of DTC[7: 0] is used for function selection: 0xx: DT = DTC [7：0] * TDTS 10x: DT = (64+ DTC [5: 0]) * TDTS * 2 110: DT = (32+ DTC [4: 0]) * TDTS * 8 111: DT = (32+ DTC [4: 0]) * TDTS * 16

Note: Based on lock configuration, AOEN, BRKV, BRKEN, FCSODIS, FCSOEN and DTC[7:0] can all be write protected. Thus it is necessary to configure write protection when writing to the TMRx_BRK register for the first time.

14.3.4.19 TMR1 and TMR8 DMA control register (TMRx_ DMACTRL)

Bit	Register	Reset value	Type	Description
Bit 15:13	Reserved	0x0	resd	Kept at its default value.
Bit 12:8	DTB	0x00	rw	DMA transfer bytes This field defines the number of DMA transfers: 00000: 1 byte 00001: 2 bytes 00010: 3 bytes 00011: 4 bytes .... 10000: 17 bytes 10001: 18 bytes
Bit 7:5	Reserved	0x0	resd	Kept at its default value.
Bit 4: 0	ADDR	0x00	rw	DMA transfer address offset ADDR is defined as an offset starting from the address of the TMRx_CTRL1 register: 00000: TMRx_CTRL1 00001: TMRx_CTRL2 00010: TMRx_STCTRL .....

14.3.4.20 TMR1 and TMR8 DMA data register (TMRx_ DMADT)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DMADT	0x0000	rw	DMA data register A write/read operation to the DMADT register accesses any TMR register located at the following address: TMRx peripheral address + ADDR*4 to TMRx peripheral address + ADDR*4 + DTB*4

15 Window watchdog timer (WWDT)

15.1 WWDT introduction

The window watchdog downcounter must be reloaded in a limited time window to prevent the watchdog circuits from generating a system reset. The window watch dog is used to detect the occurrence of system malfunctions.

The window watchdog timer is clocked by a divided APB1_CLK. The presion of the APB1_CLK enables the window watchdog to take accurate control of the limited window.

15.2 WWDT main features

- 7-bit downcounter
- If the watchdog is enabled, a system reset is generated when the value of the downcounter is less than 0x40 or when the downcounter is reloaded outside the window.
- The downcounter can be reloaded by enabling the counter interrupt.

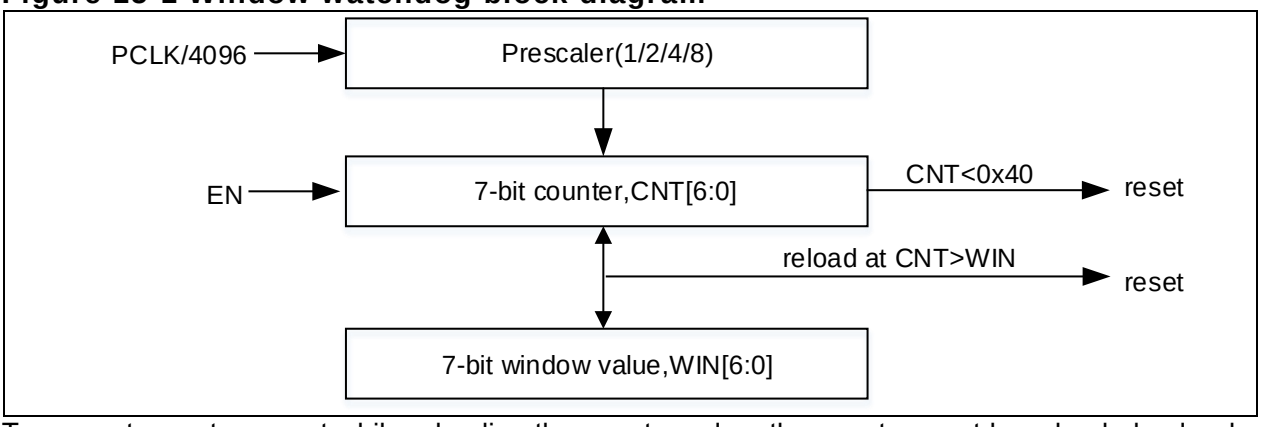
15.3 WWDT functional overview

If the watchdog is enabled, a system reset is generated at the following contions:

When the 7-bit downcounter scrolls from 0x40 to 0x3F;

When the counter is reloaded while the 7-bit downcounter is greater than the value programmed in the window register.

Figure 15-1 Window watchdog block diagram



To prevent a system reset while reloading the counter value, the counter must be reloaded only when its value is less than the value stored in the window register but greater than 0x40.

The WWDT counter is clocked by a divided APB1_CLK, with the division factor being defined by the DIV[1: 0] bit in the WWDT_CFG register. The counter value defines the maximum counter period before the watchdow generates a reset. The WIN[6: 0] bit can be used to configure the window value freely.

WWDT offers reload counter interrupt feature. If enabled, the WWDT will set the RLDF flag when the counter value reaches 0x40h, and an interrupt is generated accordingly. The interrupt service routine (ISTS) can be used to reload the counter to prevent a system reset. Note that if CNT[6]=0, setting the WWDTEN bit will generate a system reset, so the CNT[6] bit must be always set (CNT[6]=1) while writing to the WWDT_CTRL register to prevent the occurrence of an immediate reset once the window watchdog is enabled.

The formula to calculate the window watchdog time out:

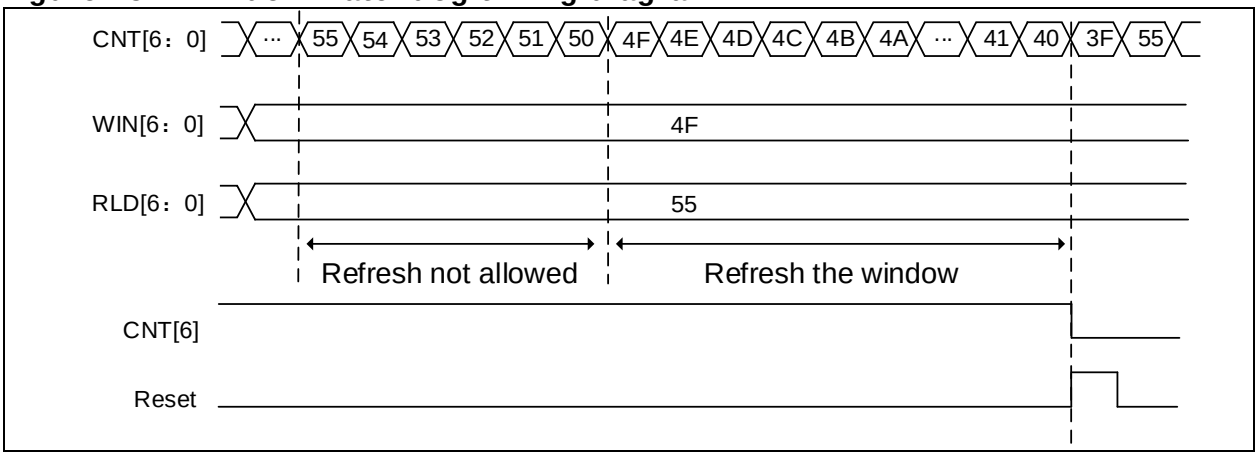
$$T_{WWDT} = T_{PCLK1} \times 4096 \times 2^{DIV[1:0]} \times (CNT[5:0] + 1); (ms)$$

Where: T_{PCLK1} refers to APB1 clock period, in ms.

Table 15-1 Minimum and maximum timeout value when PCLK1=72 MHz

Prescaler	Min. Timeout value	Max. Timeout value
0	56.5μs	3.64ms
1	113.5μs	7.28ms
2	227.5μs	14.56ms
3	455μs	29.12ms

Figure 15-2 Window watchdog timing diagram



15.4 Debug mode

When the microcontroller enters debug mode (Cortex®-M4F core halted), the WWDT counter stops counting by setting the WWDT_PAUSE in the DEBUG module.

15.5 WWDT registers

These peripheral registers must be accessed by word (32 bits).

Table 15-2 WWDT register map and reset value

Register	Offset	Reset value
WWDT_CTRL	0x00	0x7F
WWDT_CFG	0x04	0x7F
WWDT_STS	0x08	0x00

15.5.1 Control register (WWDT_CTRL)

Bit	Register	Reset value	Type	Description
Bit 31: 8	Reserved	0x000000	resd	Kept at its default value.
Bit 7	WWDTEN	0x0	rw1s	Window watchdog enable 0: Disabled 1: Enabled This bit is set by software, but can be cleared only after reset.
Bit 6: 0	CNT	0x7F	rw	Downcounter When the counter counts down to 0x3F, a reset is generated.

15.5.2 Configuration register (WWDT_CFG)

Bit	Register	Reset value	Type	Description
Bit 31: 10	Reserved	0x000000	resd	Kept at its default value.
Bit 9	RLDIEN	0x0	rw	Reload counter interrupt 0: Disabled 1: Enabled
Bit 8: 7	DIV	0x0	rw	Clock division value 00: PCLK1 divided by 4096 01: PCLK1 divided by 8192 10: PCLK1 divided by 16384 11: PCLK1 divided by 32768
Bit 6: 0	WIN	0x7F	rw	Window value if the counter is reloaded while its value is greater than the window register value, a reset is generated. The counter must be reloaded between 0x40 and WIN[6: 0].

15.5.3 Status register (WWDT_STS)

Bit	Register	Reset value	Type	Description
Bit 31: 1	Reserved	0x0000 0000	resd	Kept at its default value.
Bit 0	RLDF	0x0	rw0c	Reload counter interrupt flag This flag is set when the downcounter reaches 0x40. 'This bit is set by hardware and cleared by software.

16 Watchdog timer (WDT)

16.1 WDT introduction

The WDT is driven by a dedicated low-speed clock (LICK). Due to the lower clock accuracy of LICK, the WDT is best suited for the applications that require lower timing accuracy and can run independently out of the main application.

16.2 WDT main features

- 12-bit downcounter
- The counter is clocked by LICK (work in Stop and Standby modes)
- If the WDT is enabled, a system reset is generated when the counter value reaches 0

16.3 WDT functional overview

WDT enable:

Both software and hardware operations can be used to enable WDT. In other words, the WDT can be enabled by writing 0xCCCC to the WDT_CMD register; or can be enabled by hardware configuring the user system area. When the WDT is enabled by hardware, it will automatically run after a power-on reset.

WDT reset conditions:

When the counter value of the WDT counts down to 0, a WDT reset is generated. Thus the WDT_CMD register must be written with the value 0xAAAA at regular intervals to reload the counter value to avoid the WDT reset.

WDT write-protected:

The WDT_DIV and WDT_RLD registers are write-protected. Writing the value 0x5555 to the WDT_CMD register will unlock write protection. The update status of these two registers are indicated by the DIVF and RLDF bits in the WDT_STS register respectively. If a different value is written to the WDT_CMD register, these two registers will be re-protected. Writing the value 0xAAAA to the WDT_CMD register also enables write protection.

WDT clock:

The WDT counter is clocked by the LICK. The LICK is an internal RC clock with a certain range of timeout period. Thus a margin should be taken into account when configuring timeout period. The LICK can be calibrated to obtain the WDT timeout with a relatively accuracy. For more details, please refer to *Section 4.1.1*.

Figure 16-1 WDT block diagram

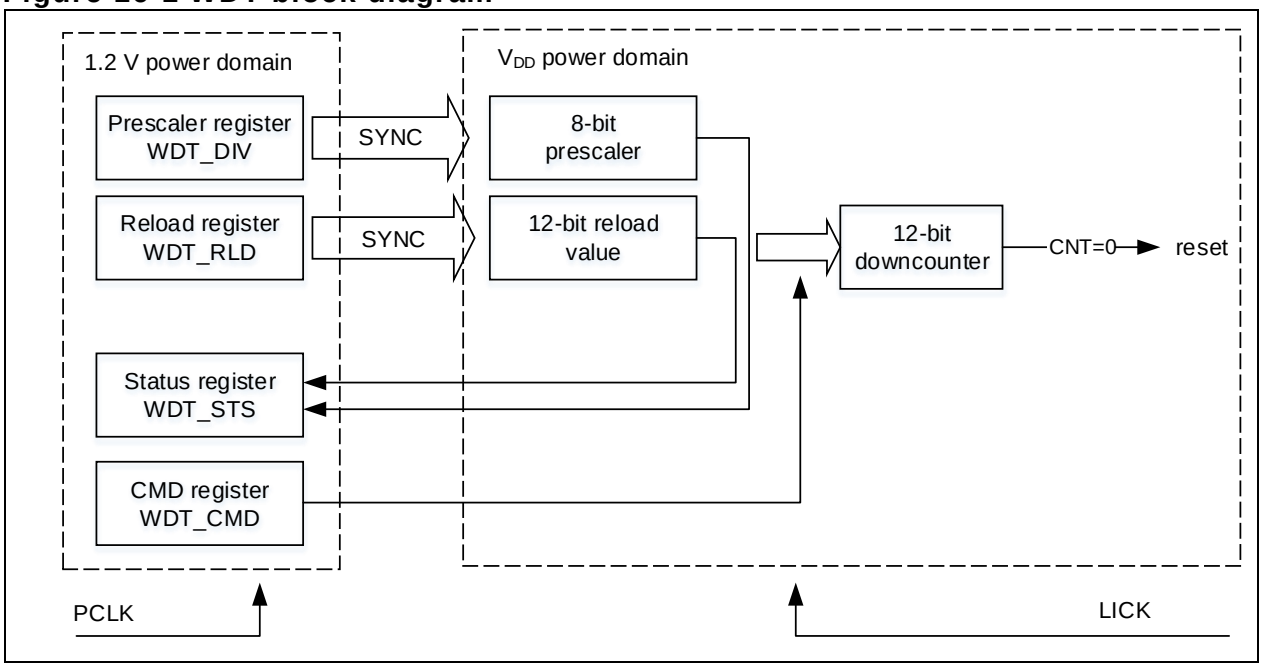


Table 16-1 WDT timeout period (LICK=40kHz)

Prescaler divider	DIV[2: 0] bits	Min.timeout (ms) RLD[11: 0] = 0x000	Max. timeout (ms) RLD[11: 0] = 0xFFF
/4	0	0.1	409.6
/8	1	0.2	819.2
/16	2	0.4	1638.4
/32	3	0.8	3276.8
/64	4	1.6	6553.6
/128	5	3.2	13107.2
/256	(6 or 7)	6.4	26214.4

16.4 Debug mode

When the microcontroller enters debug mode (Cortex®-M4F core halted), the WDT counter stops counting by setting the WDT_PAUSE in the DEBUG module.

16.5 WDT registers

These peripheral registers must be accessed by words (32 bits).

Table 16-2 WDT register and reset value

Register	Offset	Reset value
WDT_CMD	0x00	0x0000 0000
WDT_DIV	0x04	0x0000 0000
WDT_RLD	0x08	0x0000 0FFF
WDT_STS	0x0C	0x0000 0000

16.5.1 Command register (WDT_CMD)

(Reset in Standby mode)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value.
Bit 15: 0	CMD	0x0000	wo	Command register 0xAAAA: Reload counter 0x5555: Unlock write-protected WDT_DIV and WDT_RLD 0xCCCC: Enable WDT. If the hardware watchdog has been enabled, ignore this operation.

16.5.2 Divider register (WDT_DIV)

(Reset in Standby mode)

Bit	Register	Reset value	Type	Description
Bit 31: 3	Reserved	0x0000 0000	resd	Kept at its default value.
Bit 2: 0	DIV	0x0	rw	Clock division value 000: LICK divided by 4 001: LICK divided by 8 010: LICK divided by 16 011: LICK divided by 32 100: LICK divided by 64 101: LICK divided by 128 110: LICK divided by 256 111: LICK divided by 256 The write protection must be unlocked in order to enable write access to the register. The register can be read only when DIVF=0.

16.5.3 Reload register (WDT_RLD)

(Reset in Standby mode)

Bit	Register	Reset value	Type	Description
Bit 31: 12	Reserved	0x00000	resd	Kept at its default value.
Bit 11: 0	RLD	0xFFF	rw	Reload value The write protection must be unlocked in order to enable write access to the register. The register can be read only when RLDF=0.

16.5.4 Status register (WDT_STS)

(Reset in Standby mode)

Bit	Register	Reset value	Type	Description
Bit 31: 2	Reserved	0x0000 0000	resd	Kept at its default value.
Bit 1	RLDF	0x0	ro	Reload value update complete flag 0: Reload value update complete 1: Reload value update is in process. The reload register WDT_RLD can be written only when RLDF=0
Bit 0	DIVF	0x0	ro	Division value update complete flag 0: Division value update complete 1: Division value update is in process. The divider register WDT_DIV can be written only when DIVF=0

17 Real-time clock (RTC)

17.1 RTC introduction

The real-time clock provides a calendar clock function. It has an internal 32-bit incremental couner that is increased by one at each second. In other words, this counter serves as a second clock. The current second value can be converted into time and date to provide a calendar function. The time and date can be modified by modifying the counter value.

The RTC module is in battery powered domain, which means that it keeps running and free from the influence of system reset and VDD power off as long as VBAT is powered.

17.2 RTC main features

- 20-bit prescaler
- 32-bit counter
- Three RTC clock sources: HEXT/128, LEXT and LICK
- Three interrupts: Second interrupt, Alarm interrupt and Overflow interrrupt

Note: The frequency of the RTC clock must be one forth slower than the PCLK1 clock.

17.3 RTC structure

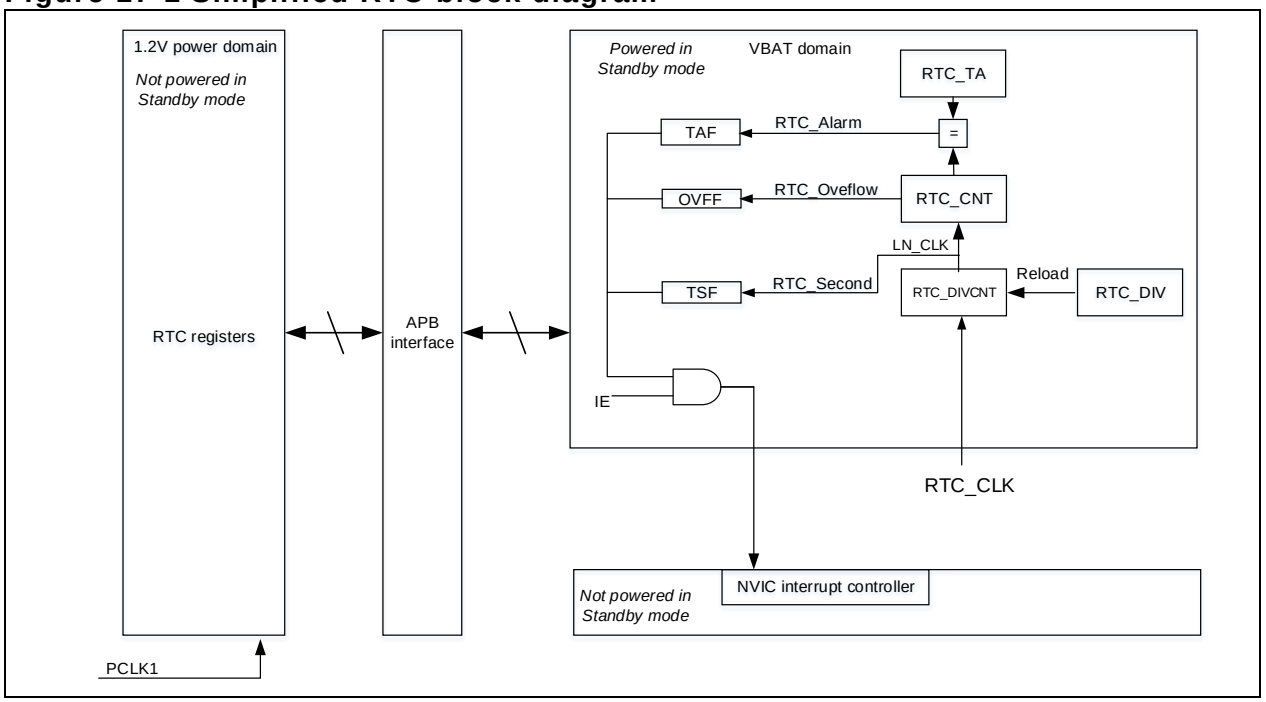
RTC consists of an APB1 interface and a RTC counter logic, as shown in Figure 17-1.

APB1 interface: It is used to interface with the APB1 bus and battery powered domain for the configuration and read access of the RTC registers.

RTC counter logic: It consists of a 20-bit prescaler and a 32-bit programmable counter. The prescaler is used to generate a RTC count clock, LN_CLK, which is usually set to 1 second in order to convert the counter value into a calendar. As the RTC counter logic is in the VBAT domain and driven by the RTC_CLK, the RTC still keeps running even if the APB1 interface is disabled. When the RTC_CLK frequency is 32.768 kHz, writing the value 0x7FFF in the prescaler load register can produce a LN_CLK of 1Hz.

The RTC counter logic is independent from the APB1 interface. The RTC registers can be configured through the APB1 interface and synchronized to the RTC counter module through the RTC_CLK; The associated flag bits arising from the RTC counter module is synchronized to the RTC registers by the PCLK1. The RTC counter module is driven by the RTC_CLK. Set RTCEN=1 to enable RTC_CLK. Configure the RTC_CLK clock source by setting the RTCSEL[1: 0]. To re-configure the RTC_CLK, it must wait until the reset of the battery powered domain before configuration.

Figure 17-1 Simplified RTC block diagram



17.4 RTC functional overview

17.4.1 Configuring RTC registers

After a power-on reset, all RTC registers are write protected. Write access to the RTC registers is allowed only when the write protection is unlocked.

Configuration procedure:

- Enable power and battery powered domain interface clock by setting PWCEN =1 and BPREN=1 in the CRM_APB1EN register
- Unlock write protection in the battery powered domain by setting BPWEN=1 in the PWC_CTRL register

Configuring DIV, CNT and ALA registers:

To enable write operation to these registers, the first step is to enter configuration mode (CFGEN = 1). Setting CFGEN = 0 to exit configuration mode, the values in these registers are actually written to the battery powered domain, which takes at least three RTCCLK cycles to complete.

Based on synchronization logic, a new value can be written to the RTC registers only when the previous RTC configuration is completed (CFGF=1).

Configuration procedure:

1. Wait until the end of register configuration (CFGF=1)
2. Enter configuration mode (CFGEN=1)
3. Configure the corresponding RTC registers
4. Exit configuration mode (CFGEN=0)
5. Wait until the end of register configuration (CFGF=1)

The registers including DIV, ALA, CNT and DIVCNT are reset only by the reset signals in the battery powered domain. The rest of the registers are asynchronously reset by system reset or power reset.

17.4.2 Reading RTC registers

Based on synchronization logic, there is a probability that the correct values have yet been uploaded from the battery powered domain to the APB1 interface while reading the RTC registers at one of the following events:

A system reset or power reset;

The microcontroller has woken up from Standby or Deepsleep modes.

In this case, the software must wait until UPDF=1 before reading RTC registers, otherwise, an error value is returned.

17.4.3 RTC interrupts

RTC supports the following interrupt requests:

- Second interrupt: If Second interrupt is enabled (TSIEN=1), a second interrupt is generated at each LN_CLK period.
- Alarm interrupt: If Alarm interrupt is enabled (TAIEN=1), an alarm interrupt is generated when the value in the TA register is equal to the CTN value.
- Overflow interrupt: If Overflow interrupt is enabled (OVFIEN=1), an overflow interrupt is generated when the counter reaches the value 0xFFFFFFFF.

The RTC global interrupt vector (RTC_IRQn) and alarm interrupt vector (RTCAlarm_IRQn) are both supported. To wake up from DEEPSLEEP mode using the RTC alarm interrupt, the RTC alarm interrupt must be enabled to use the RTCAlarm_IRQn vector, and the EXINT 17 is configured as interrupt mode at the same time; To wake from DEEPSLEEP mode using the RTC alarm event, the EXINT 17 must be configured as event mode, but without the need of enabling the RTC alarm interrupt. When the RTC alarm event is used to wake up from Standby mode, it is not necessary to enable alarm interrupt and EXINT 17.

RTC flag bits are described as follows:

- RTC Second flag (TSF): RTC counter update flag. The flag is set one RTC_CLK period before the update of the RTC counter
- RTC Alarm flag (TAF): The flag is set one RTC_CLK period before the counter value reaches the RTC alarm value in the alarm register increased by one (TA+1)
- RTC Overflow flag (OVFF): The flag is set one RTC_CLK period before the RTC counter value reaches the value 0x00000000

When the RTC interrupts are generated, clearing the corresponding flag bits means that the interrupt requests have been received. The flag bits can only be set by hardware, and cleared by software. After reset, all interrupts will be disabled. The flag bits will no longer be updated when the APB1 clock stops running.

Figure 17-2 RTC second and alarm waveform example with DIV=0004 and TA=00004

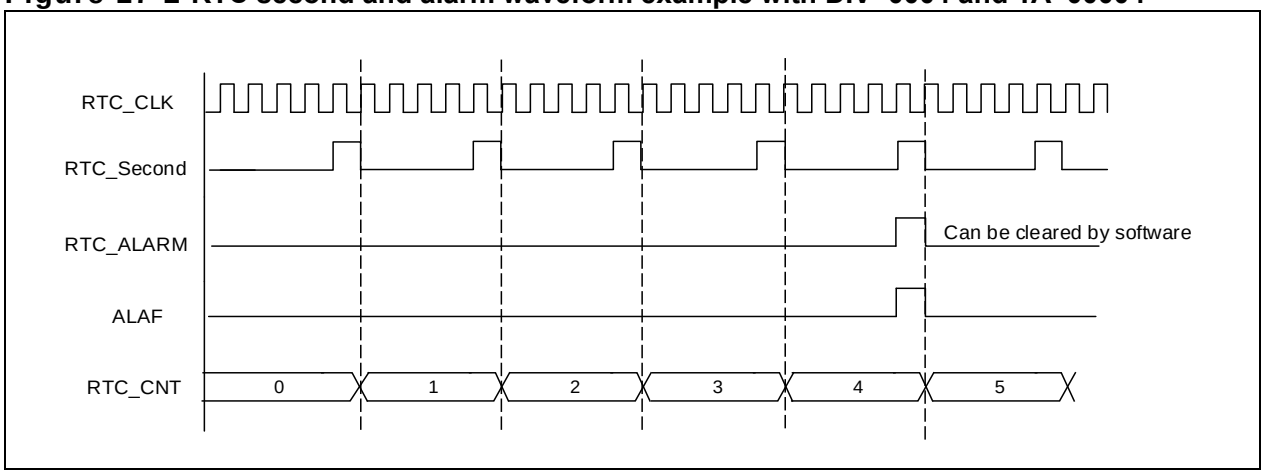


Figure 17-3 RTC overflow waveform example with DIV=0004

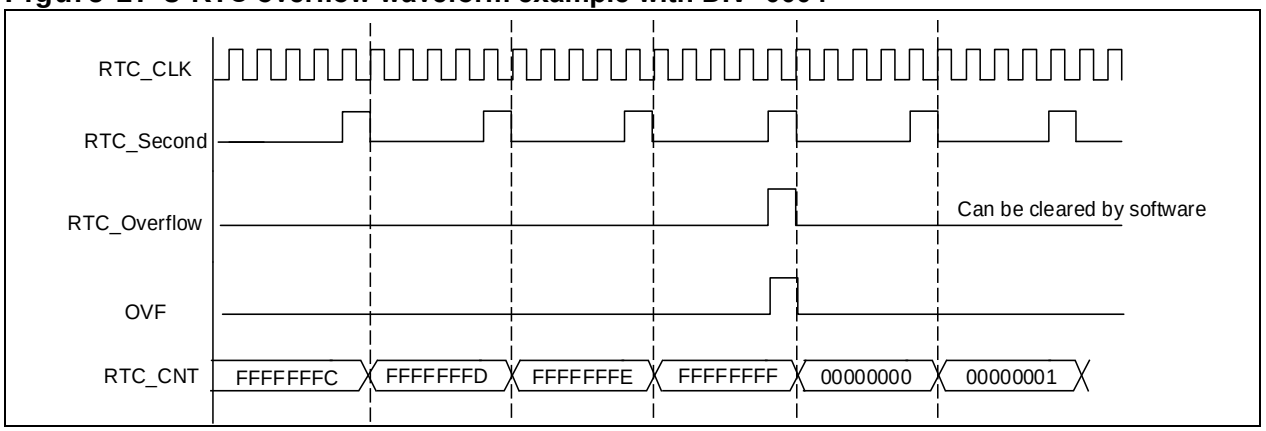

17.5 RTC registers

These peripheral registers must be accessed by word (32 bits).

RTC registers are 16-bit addressable registers.

Table 17-1 RTC register map and reset values

Register	Offset	Reset value
RTC_CTRLH	0x00	0x0000
RTC_CTRLL	0x04	0x0020
RTC_DIVH	0x08	0x0000
RTC_DIVL	0x0C	0x8000
RTC_DIVCNTH	0x10	0x0000
RTC_DIVCNTL	0x14	0x8000
RTC_CNTH	0x18	0x0000
RTC_CNTL	0x1C	0x0000
RTC_TAH	0x20	0xFFFF
RTC_TAL	0x24	0xFFFF

17.5.1 RTC control register high (RTC_CTRLH)

Bit	Register	Reset value	Type	Description
Bit 15: 3	Reserved	0x0000	resd	Kept at its default value.
Bit 2	OVFIEN	0x0	rw	Overflow interrupt enable This bit is used to enable overflow interrupt. 0: Disabled 1: Enabled
Bit 1	TAIEN	0x0	rw	Time alarm interrupt enable This bit is used to enable alarm interrupt. 0: Disabled 1: Enabled
Bit 0	TSIEN	0x0	rw	Time second interrupt enable This bit is used to enable second interrupt. 0: Disabled 1: Enabled。

Note: This register is reset after system reset. Refer to 17.4.1 for more details.

17.5.2 RTC control register low (RTC_CTRLL)

Bit	Register	Reset value	Type	Description
Bit 15: 6	Reserved	0x000	resd	Kept at its default value.
Bit 5	CFGF	0x1	ro	RTC configuration finish Indicates whether the last write operation on the RTC registers has been completed or not. Write access to the RTC registers is allowed only when this bit is set. 0: Last write operation on RTC registers is ongoing 1: Last write operation on RTC registers ends.
Bit 4	CFGEN	0x0	rw	RTC Configuration enable This bit is set to enter configuration mode in order to enable write access to the CNT, ALA, DIVCNT registers. 0: Exit configuration mode 1: Enter configuration mode
Bit 3	UPDF	0x0	rw0c	RTC update finish flag This bit indicates wheter the update of the RTC registers has been completed or not. This bit is set by hardware when the CNT and DIVCNT are updated. Before any read operation, this bit must be cleared by software, and the user must wait until this bit is set. 0: RTC registers not updated. 1: RTC registers updated.
Bit 2	OVFF	0x0	rw0c	Overflow flag This bit is set when the counter overflows. An interrupt is generarted if OVFIEN =1. 0: Overflow not detected. 1: Overflow occurred.
Bit 1	TAF	0x0	rw0c	Time alarm flag This bit is set when an alarm event is detected. An interrupt is generated if TAIEN =1. 0: Alarm not detected. 1: Alarm detected.
Bit 0	TSF	0x0	rw0c	Time second flag This bit is set when a second event is detected. An interrupt is generated if TSIEN =1. 0: Second event not detected. 1: Second event detected.

17.5.3 RTC divider register (RTC_ DIVH/RTC_DIVL)

RTC divider register high (RTC_DIVH)

Bit	Register	Reset value	Type	Description
Bit 15: 4	Reserved	0x000	resd	Kept at its default value.
Bit 3: 0	DIV	0x0	wo	RTC divider This field is used to define the counter clock frequency according to the formula: fLN_CLK = fRTCCLK/(DIV[19: 0]+1)

RTC divider register high (RTC_DIVL)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DIV	0x8000	wo	RTC divider This field is used to define the counter clock frequency according to the formula: fLN_CLK = fRTCCLK/(DIV[19: 0]+1) Note: the zero value is not recommended.

17.5.4 RTC divider counter register (RTC_ DIVCNTH/RTC_DIVCNTL)

RTC divider counter register high (RTC_DIVCNTH)

Bit	Register	Reset value	Type	Description
Bit 15: 4	Reserved	0x000	resd	Kept at its default value.
Bit 3: 0	DIVCNT	0x0	ro	RTC clock divider counter

RTC divider counter register low (RTC_DIVCNTL)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DIVCNT	0x8000	ro	RTC clock divider counter

17.5.5 RTC counter value register (RTC_CNTH/RTC_CNTL)

RTC counter value register high (RTC_CNTH)

Bit	Register	Reset value	Type	Description
Bit 15: 0	CNT	0x0000	rw	RTC counter value This field is used to configure or read the high part of the RTC counter value.

RTC counter value register low (RTC_CNTL)

Bit	Register	Reset value	Type	Description
Bit 15: 0	CNT	0x0000	rw	RTC counter value This field is used to configure or read the low part of the RTC counter value.

17.5.6 RTC alarm register (RTC_TAH/RTC_TAL)

RTC alarm register high (RTC_TAH)

Bit	Register	Reset value	Type	Description
Bit 15: 0	TA	0xFFFF	wo	Time alarm clock value This field is used to define the high part of the alarm value.

RTC alarm register low (RTC_TAL)

Bit	Register	Reset value	Type	Description
Bit 15: 0	TA	0xFFFF	wo	Time alarm clock value This field is used to define the low part of the alarm value.

18 Battery powered registers (BPR)

18.1 BPR introduction

The battery powered registers are located in the battery powered domain and powered by VDD/VBAT. These registers are forty two 16-bit registers. Upon a tamper event or when battery powered domain reset occurs, the contents in these registers are cleared so as to ensure the highest level of data security.

18.2 BPR main features

- Forty two 16-bit registers
- Reset at a tamper event
- Configurable PC13 pin multiplexed function output

18.3 BPR functional overview

To enable access to the battery powered registers, the PWCEN, BPREN and BPWEN must be set to 1.

The BPR provides tamper detection function for the purpose of data security. If enabled, the polarity of the TAMPER pin can be configured through TPP bit. Once a tamper event is detected, the TPEF bit will be set, and the battery powered registers will be cleared accordingly; If the tamper interrupt is enabled, an interrupt will be generated, with the TPIF bit being set to 1.

In addition, the BPR also has RTC calibration feature so that the RTC clock can be slowed down up to 121 ppm by setting the CALVAL[6: 0] bits. If the RTC calibration output is enabled, the calibrated RTC/64 clock will be output on the TAMPER pin (CCOS=1).

Note: When TPP=0 or 1, if the TAMPER pin is already high or low before it is enabled by setting the TPEN bit, an extra tamper event is generated when TPEN=1, despite the fact that there was no rising or falling edge on the TAMPER pin.

18.4 BPR registers

These peripheral registers must be accessed by word (32 bits).

BPR registers are 16-bit addressable registers.

Table 18-1 BPR register map and reset values

Register	Offset	Reset value
BPR_DT1	0x04	0x0000
BPR_DT2	0x08	0x0000
BPR_DT3	0x0C	0x0000
BPR_DT4	0x10	0x0000

18.4.1 Battery powered data register x (BPR_DTx) (x = 1 ··· 42)

Bit	Register	Reset value	Type	Description
Bit 15: 0	DT	0x0000	rw	Battery powered domain data This field is used for data storage. The BPR_DTx registers can be set only by a battery powered domain reset or by a tamper event.

18.4.2 RTC calibration register (BPR_ RTCCAL)

Bit	Register	Reset value	Type	Description
Bit 15: 10	Reserved	0x00	resd	Kept at its default value.
Bit 9	OUTSEL	0x0	rw	Output selection This bit is used to select either the RTC alarm event or the second event. 0: RTC alarm event output 1: Second event output Note: This bit is cleared only by a battery powered domain reset.
Bit 8	OUTEN	0x0	rw	Output enable 0: Disabled 1: Enabled Note: This bit is cleared only by a battery powered domain reset. It is used to enable the event that is output on the TAMPER pin. The TAMPER function can not be used if the output is enabled.
Bit 7	CALOUT	0x0	rw	Calibration clock output 0: No effect 1: Output the RTC clock with a frequency divided by 64 on the TAMPER pin. The TAMPER function can not be used when the calibration clock output is enabled. Note: This bit is cleared when the VDD supply is powered off.
Bit 6: 0	CALVAL	0x00	rw	Calibration value This value indicates the number of clock filtered in one cycle (2^{20} clocks). The clock frequency is reduced with a minium accuracy of $1000000/2^{20}$ppm. The RTC clock can be slowed down from 0 to 121 ppm.

18.4.3 BPR control register (BPR_ CTRL)

Bit	Register	Reset value	Type	Description
Bit 15: 2	Reserved	0x0000	resd	Kept at its default value.
Bit 1	TPP	0x0	rw	TAMPER pin polarity This bit defines the polarity of the TAMPER pin. The contents in the data registers are cleared when an active level is detected. 0: Active high 1: Active low *Note: To avoid unwanted tamper event, it is recommended to modify the polarity of the TAMPER pin when it is disabled.*
Bit 0	TPEN	0x0	rw	TAMPER pin enable 0: Disabled. The TAMPER pin can be used as GPIO. 1: Enabled

18.4.4 BPR control/status register (BPR_ CTRLSTS)

Bit	Register	Reset value	Type	Description
Bit 15: 10	Reserved	0x00	resd	Kept at its default value.
Bit 9	TPIF	0x0	ro	Tamper interrupt flag This bit is set when a tamper event is detected and the TPIEN is set. 0: No tamper event 1: A tamper event is detect. Note: This bit is reset only a system reset or exit Standby mode.
Bit 8	TPEF	0x0	ro	Tamper event flag This bit is set when a tamper event is detected. 0: No tamper event 1: A tamper event is detected Note: A tamper event will reset the BPR_DTx registers. Do not write the BPR_DTx registers when TPEF=1.
Bit 7: 3	Reserved	0x00	resd	Kept at its default value.
Bit 2	TPIEN	0x0	rw	Tamper pin interrupt enable 0: Disabled 1: Enabled Note: A tamper interrupt does not wake up the core from low-power modes.
Bit 1	TPIFCLR	0x0	wo	Tamper interrupt flag clear Setting this bit clears the TAMPER interrupt. 0: No effect 1: Clear the tamper interrupt
Bit 0	TPEFCLR	0x0	wo	Tamper event flag clear Setting this bit clears the TAMPER event flag. 0: No effect 1: Clear the tamper event flag

19 Analog-to-digital converter (ADC)

19.1 ADC introduction

The ADC is a peripheral that converts an analog input signal into a 12-bit digital signal. Its sampling rate is as high as 2 MSPS. It has up to 18 channels for sampling and conversion.

19.2 ADC main features

In terms of analog part:

- 12-bit resolution
- Self-calibration time: 172 ADC clock cycles
- ADC conversion time
- ADC conversion time is 0.5 μs at 28 MHz
- ADC supply requirement: Refer to the Datasheet
- ADC input range: $V_{REF-} \leqslant V_{IN} \leqslant V_{REF+}$

In terms of digital control:

- Regular channels and injected channels with different priority
- Regular channels and injected channels both have their own trigger detection circuit
- Each channel can independently define its own sampling time
- Conversion sequence management supports various multi-channel conversion modes
- Optional data alignment mode
- Programmable voltage monitor threshold
- Regual channels with DMA transfers
- Interrupt generation at one of the following events:
  - End of the conversion of preempted group
  - End of the conversion of channels
  - Voltage outside the threshold programmed
  - ADC Master/slave mode

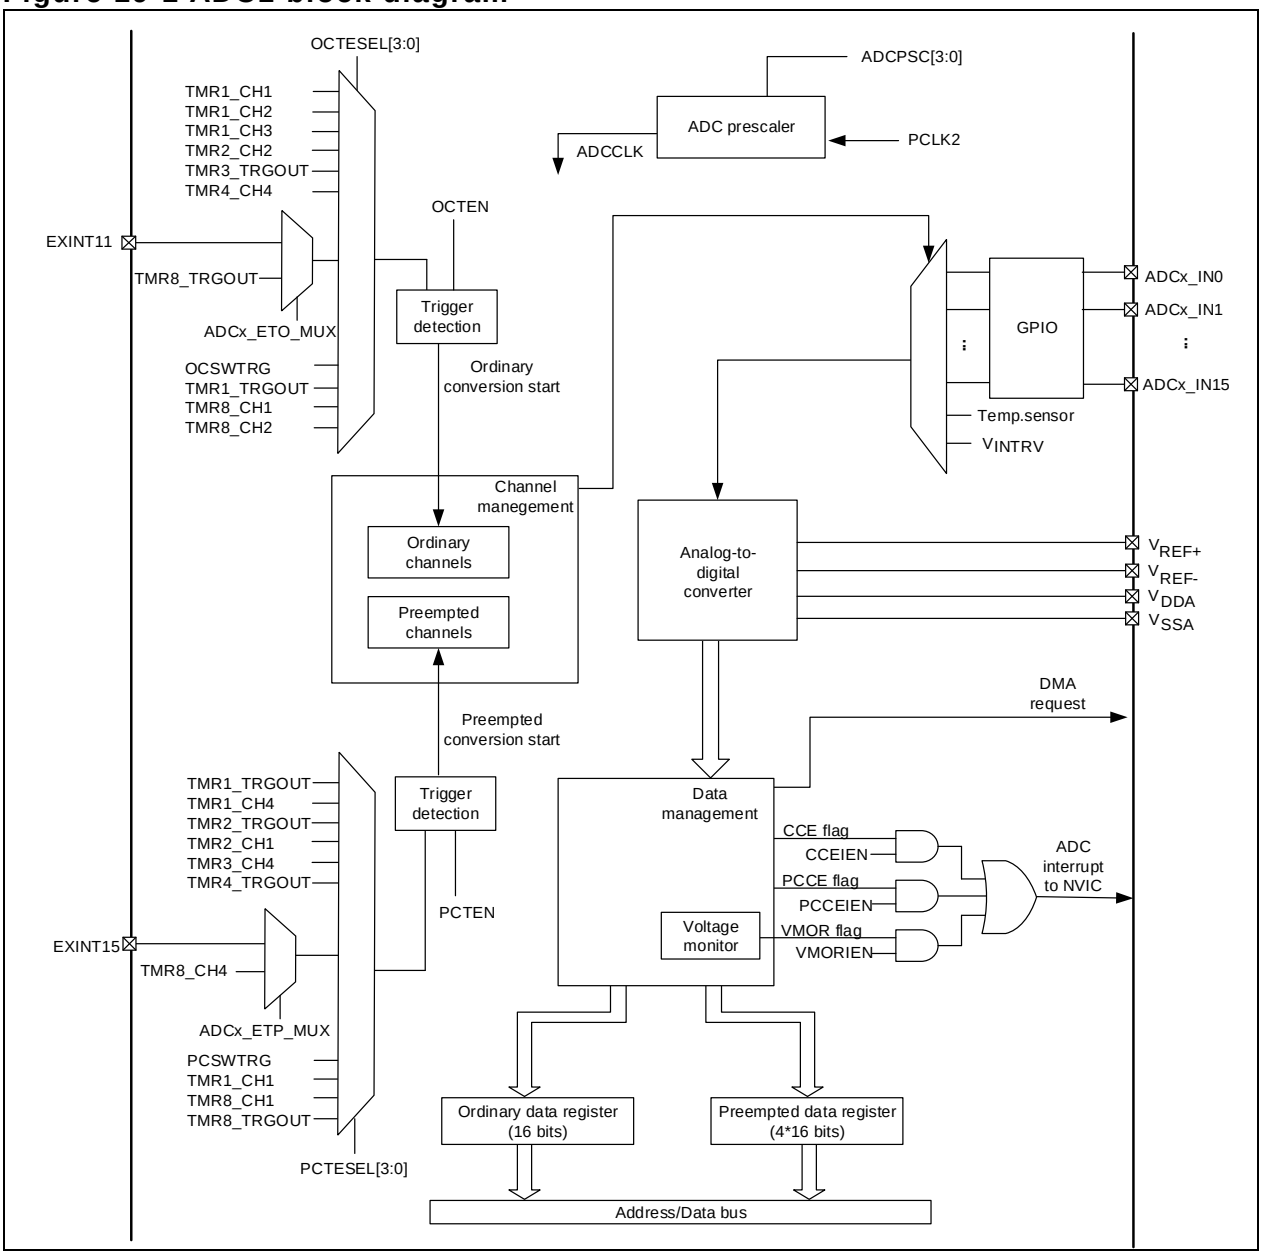
19.3 ADC structure

Figure 19-1 shows the block diagram of ADC1.

Differences between ADC2 and ADC1:

1. ADC2 is not connected to the internal temperature sensor and internal reference voltage
2. ADC2 has no DMA request. Refer to *Section 19.4.2* for more details

Figure 19-1 ADC1 block diagram



Input pin description:

- V_{DDA}: Analog supply, ADC analog supply
- V_{SSA}: Analog supply ground, ADC analog supply ground
- V_{REF+}: Analog reference positive, high/positive reference voltage for the ADC
- V_{REF-}: Analog reference negative, low/negative reference voltage for the ADC
- ADCx_IN: Analog input signal channels

Refer to the Datasheet for more information on the connectivity and voltage range of input pins.

19.4 ADC functional overview

19.4.1 Channel management

Analog signal channel input:

There are 18 analog signal channel inputs for each of the ADCs, expressed by ADC_Inx (x=0 to 17).

- ADC1_IN0 to ADC1_IN15 are referred to as the external analog input, ADC1_IN16 as the internal temperature sensor, and ADC1_IN17 as the internal reference voltage.
- ADC2_IN0 to ADC2_IN15 are referred to as the external analog input, and ADC2_IN16 and ADC2_IN17 as Vss

Channel conversion

The conversions are divided into two groups: ordinary and preempted ones. The preempted group has priority over the ordinary group.

If the preempted channel trigger occurs during the ordinary channel conversion, then the ordinary channel conversion is interrupted, giving the priority to the preempted channel, and the ordinary channel continues its conversion at the end of the preempted channel conversion. If the ordinary channel trigger occurs during the preempted channel conversion, the ordinary channel conversion won't start until the end of the preempted channel conversion.

Program the ADC_Inx into the ordinary channel sequence (ADC_OSQx) and the preempted channel sequence (ADC_PSQ), and the same channel can be repeated, the total number of sequences is determined by OCLEN and PCLEN, then it is ready to enable the ordinary channel or preempted channel conversion.

19.4.1.1 Internal temperature sensor

The temperature sensor is connected to ADC1_IN16. Before the temperature sensor channel conversion, it is required to enable the ITSRVEN bit in the ADC_CTRL2 register and wait after power-on time.

Obtain the temperature using the following formula:

Temperature (in °C) = {(V 25 - V_{SENSE}) / Avg_Slope} + 25.

Where,

V_{25} = V_{SENSE} value for 25° C and

Avg_Slope = Average Slope for curve between Temperature vs. V_{SENSE} (given in mV/° C).

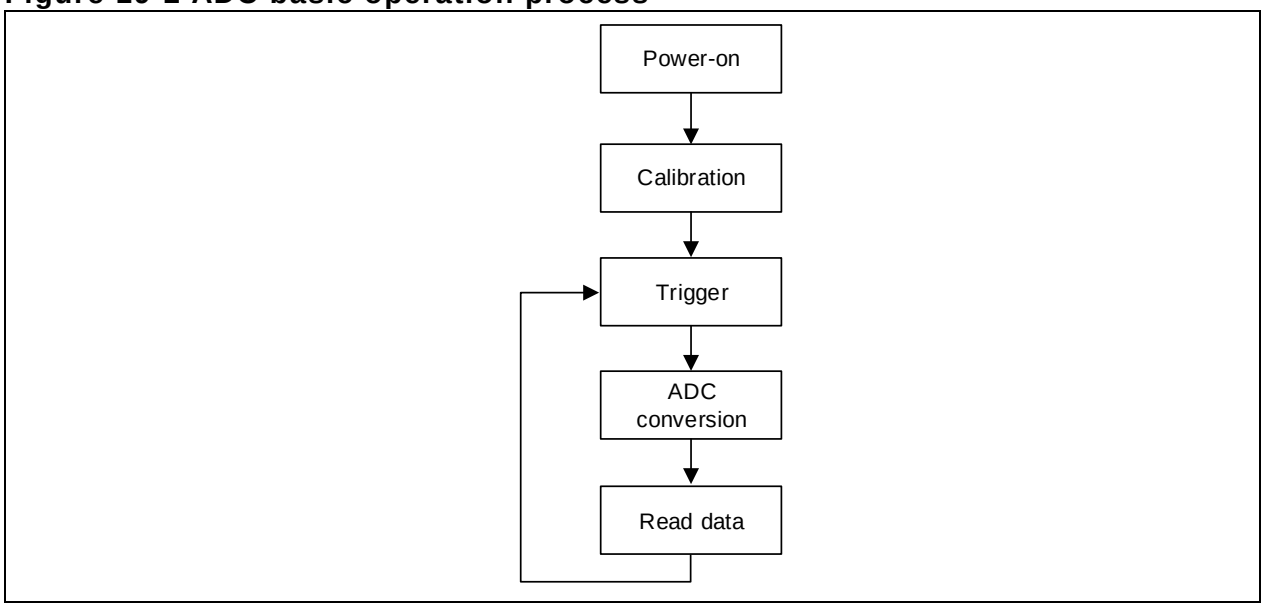
19.4.1.2 Internal reference voltage

The internal reference voltage of the typical value 1.2 V is connected to ADC1_IN17. It is required to enable the ITSRVEN bit in the ADC_CTRL2 register before the internal reference channel conversion. The converted data of such channel can be used to calculate the external reference voltage.

19.4.2 ADC operation process

Figure 19-2 shows the basic operation process of the ADC. It is recommended to do the calibration after the initial power-on in order to improve the accuracy of sampling and conversion. After the completion of calibration, trigger is used to start ADC sampling conversion. Read data at the end of the conversion.

Figure 19-2 ADC basic operation process



19.4.2.1 Power-on and calibration

Power-on

Set the ADCxEN bit in the CRM_APB2EN register to enable ADC clocks: PCLK2 and ADCCLK.

Program the desired ADCCLK frequency by setting the ADCDIV bit in the CRM_CFG register. The ADCCLK is derived from PCLK2 frequency division.

Note: ADCCLK must be less than 28 MHz.

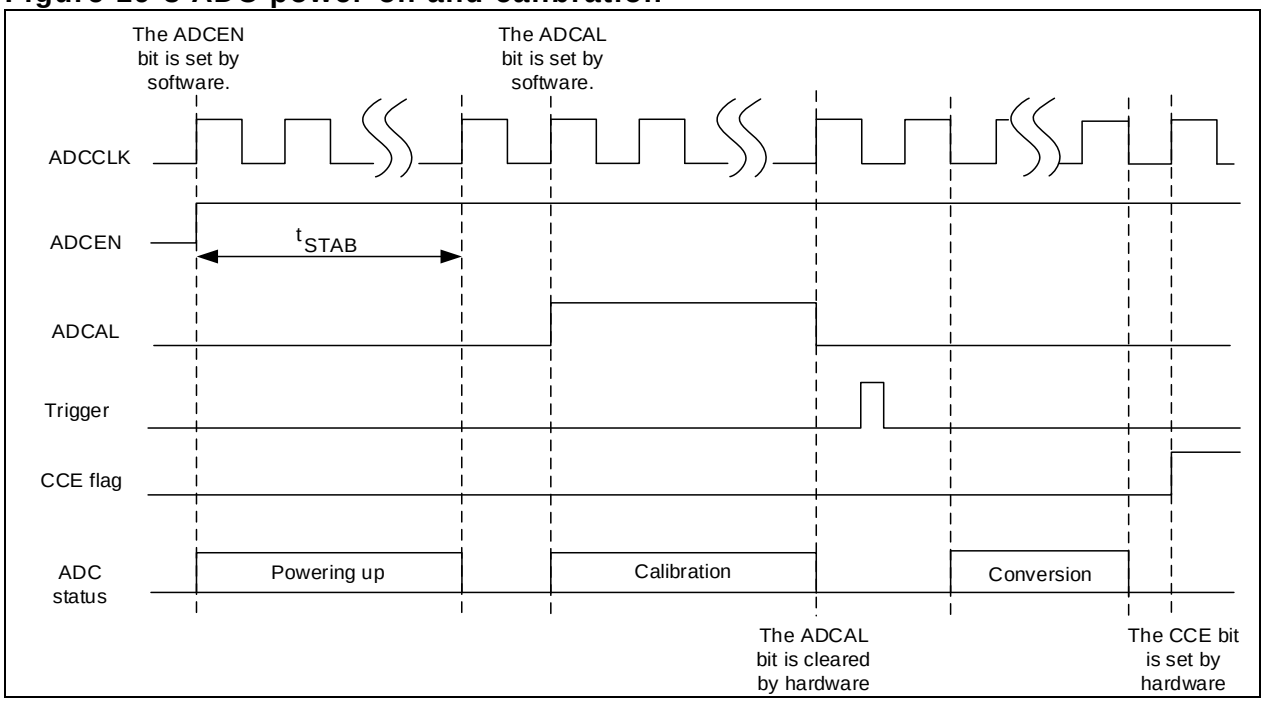
Then set the ADCEN bit in the ADC_CTRL2 register to supply the ADC, and wait until the t_{STAB} is reached before subsequent operations. Clear the ADCEN bit will stop the ADC conversion and result in a reset. In the meantime, the ADC is switched off to save power.

Calibration

After power-on, the calibration is enabled by setting the ADCAL bit in the ADC_CTRL2 register. When the calibration is over, the ADCAL bit is cleared by hardware and the conversion is performed by software trigger.

After each calibration, the calibration value is stored in the ADC_ODT register, and then value is automatically sent back to the ADC so as to eliminate capacitance errors. The storage of the calibration value will not set the CCE flag, or generate interrupts or DMA requests.

Figure 19-3 ADC power-on and calibration



19.4.2.2 Trigger

The ADC triggers contain ordinary channel trigger and preempted channel trigger. The ordinary channel conversion is triggered by ordinary channel triggers while the preempted channel conversion is triggered by preempted ones. When the OCTEN or PCTEN bit is set in the ADC_CTRL2 register, only the rising edge of the trigger source can start the conversion.

The conversion can be triggered by software write operation to the OCSWTRG and PCSWTRG bits in the ADC_CTRL2 register, or by an external event. The external events include timer and pin triggers. The OCTESEL and PCTESEL bits in the ADC_CTRL2 register are used to select specific trigger sources, as shown in *Table 19-1*.

The ordinary channel has another special trigger source, that is, enable the ADCEN bit repeatedly to trigger the conversion. In this case, the ordinary channel conversion can be triggered without the need of the OCTEN enable bit in the ADC_CTRL2 register.

Table 19-1 Trigger sources for ADC1 and ADC2

OCTESEL		Source	PCTESEL		Source
0000		TMR1_CH1 event	0000		TMR1_TRGOUT event
0001		TMR1_CH2 event	0001		TMR1_CH4 event
0010		TMR1_CH3 event	0010		TMR2_TRGOUT event
0011		TMR2_CH2 event	0011		TMR2_CH1 event
0100		TMR3_TRGOUT event	0100		TMR3_CH4 event
0101		TMR4_CH4 event	0101		TMR4_TRGOUT event
0110	ADCx_ETO_MUX=0	EXINT line11 external pin	0110	ADCx_ETP_MUX=0	EXINT line15 external pin
	ADCx_ETO_MUX=1	TMR8_TRGOUT event		ADCx_ETP_MUX=1	TMR8_CH4 event
0111		OCSWTRG bit	0111		PCSWTRG bit
1000		Reserved	1000		Reserved
1001		Reserved	1001		Reserved
1010		Reserved	1010		Reserved
1011		Reserved	1011		Reserved
1100		Reserved	1100		Reserved
1101		TMR1_TRGOUT event	1101		TMR1_CH1 event
1110		TMR8_CH1 event	1110		TMR8_CH1 event
1111		TMR8_CH2 event	1111		TMR8_TRGOUT event

19.4.2.3 Sampling and conversion sequence

The sampling period can be configured by setting the CSPTx bit in the ADC_SPT1 and ADC_SPT2 registers. A single conversion time is calculated with the following formula:

$$\text{A single one conversion tiem (ADCCLK period)} = \text{sampling time} + 12.5$$

Example:

If the CSPTx selects 1.5 period, one conversion requires 1.5+12.5=14 ADCCLK periods

If the CSPTx selects 7.5 period, one conversion requires 7.5+12.5=20 ADCCLK periods.

19.4.3 Conversion sequence management

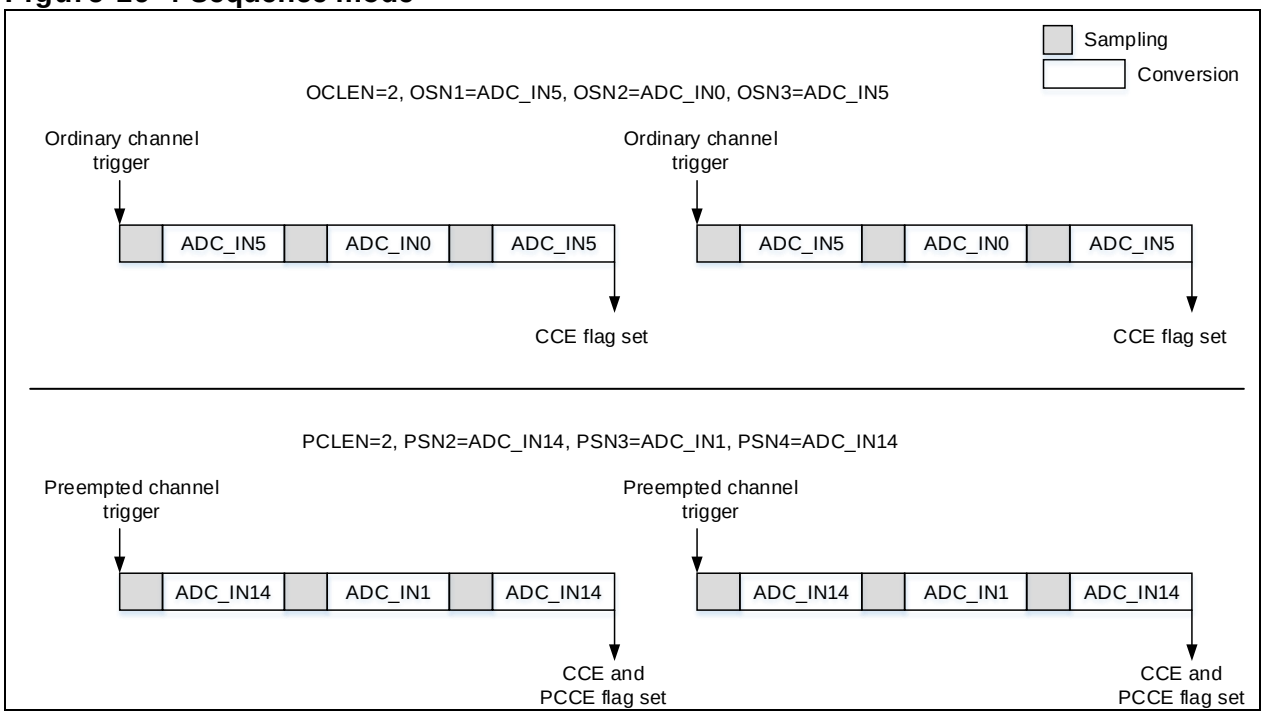
Only one channel is converted at each trigger event by default, that is, OSN1-defined channel or PSN4-defined channel.

The detailed conversion sequence modes are described in the following sections. With this, the channels can be converted in a specific order.

19.4.3.1 Sequence mode

The sequence mode is enabled by setting the SQEN bit in the ADC_CTRL1 register. The ADC_OSQx registers are used to configure the sequence and total number of the ordinary channels while the ADC_PSQ register is used to define the sequence and total number of the preempted channels. If the sequence mode is enabled, a single trigger event enables the conversion of a group of channels in order. The ordinary channels start converting from the QSN1 while the preempted channels starts from the PSNx, where x=4-PCLEN. *Figure 19-4* shows an example of the behavior in sequence mode.

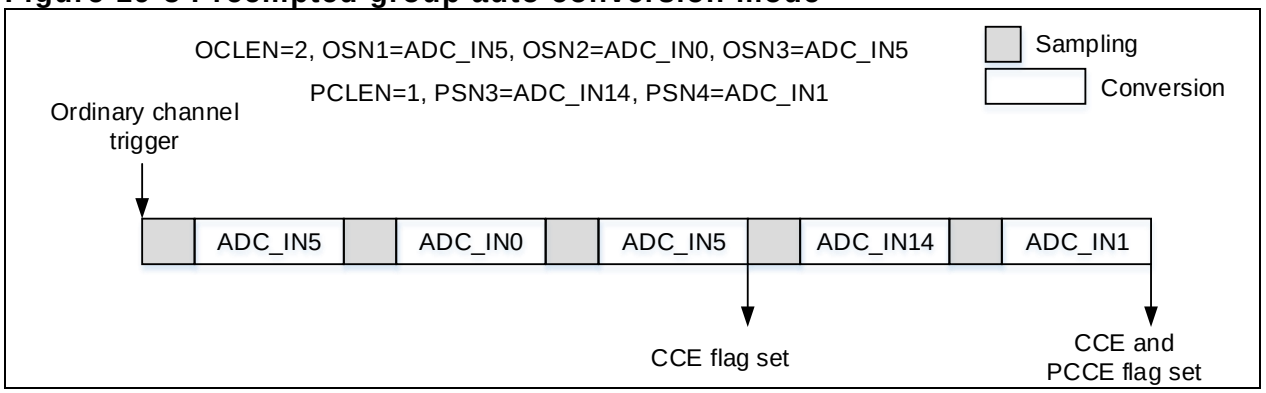
Figure 19-4 Sequence mode



19.4.3.2 Automatic preempted group conversion mode

The automatic preempted group conversion mode is enabled by setting the PCAUTOEN bit in the ADC_CTRL1 register. Once the ordinary channel conversion is over, the preempted group will automatically continue its conversion. This mode can work with the sequence mode. The preempted group conversion starts automatically at the end of the conversion of the ordinary group. *Figure 19-5* shows an example of the behavior when the automatic preempted group conversion mode works with the ordinary group.

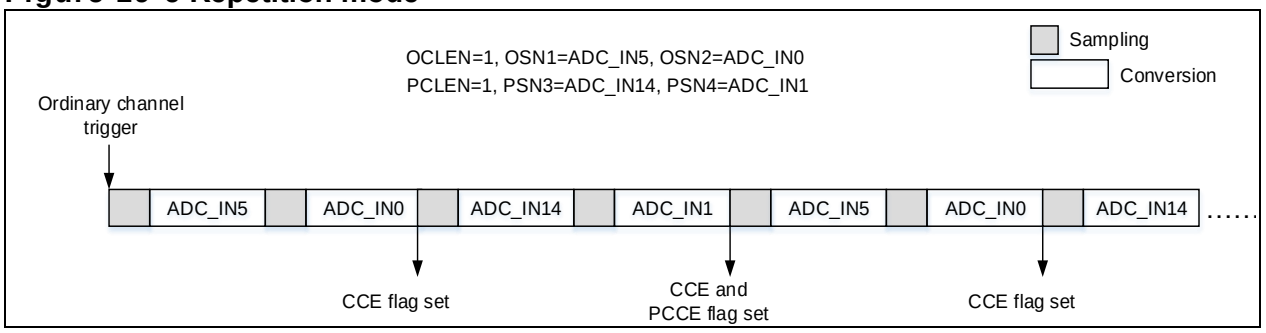
Figure 19-5 Preempted group auto conversion mode



19.4.3.3 Repetition mode

The repetition mode is enabled by setting the RPEN bit in the ADC_CTRL2 register. When a trigger signal is detected, the ordinary channels will be converting repeatedly. This mode can work with the ordinary channel conversion in the sequence mode to enable the repeated conversion of the ordinary group. Such mode can also work with the preempted group auto conversion mode to repeatedly convert the ordinary group and preempted group in sequence. *Figure 19-6* shows an example of the behavior when the repetition mode works with the sequence mode and preempted group auto conversion mode.

Figure 19-6 Repetition mode



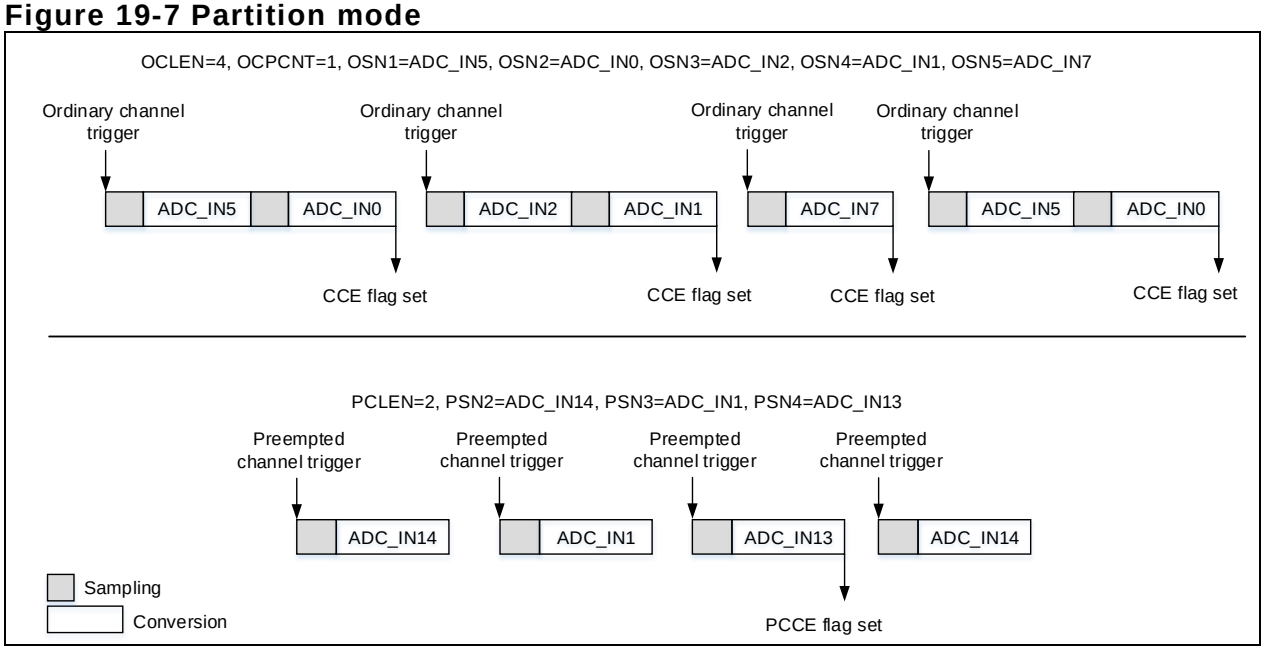
19.4.3.4 Partition mode

The partition mode of the ordinary group can be enabled by setting the OCPEN bit in the ADC_CTRL1 register. In this mode, the ordinary group conversion sequence length (OCLEN bit in the ADC_OSQ1 register) is divided into a smaller sub-group, in which the number of the channels is programmed with the OCPCNT bit in the ADC_CTRL1 register. A single trigger event will enable the conversion of all the channels in the sub-group. Each trigger event selects different sub-group in order.

Set the PCPEN bit in the ADC_CTRL1 register will enable the partition mode of the preempted group. In this mode, the ordinary group conversion sequence length (OCLEN bit in the ADC_OSQ1 register) is divided into a sub-group with only one channel. A single one trigger event will convert the channel in the sub-group. Each trigger event select different sub-group in order.

The partition mode cannot be used with the repetition mode at the same time. The partition mode of the ordinary group cannot be used with that of the preempted group at the same time. *Figure 19-7* shows an example of the behavior in partition mode for ordinary group and preempted group.

Figure 19-7 Partition mode



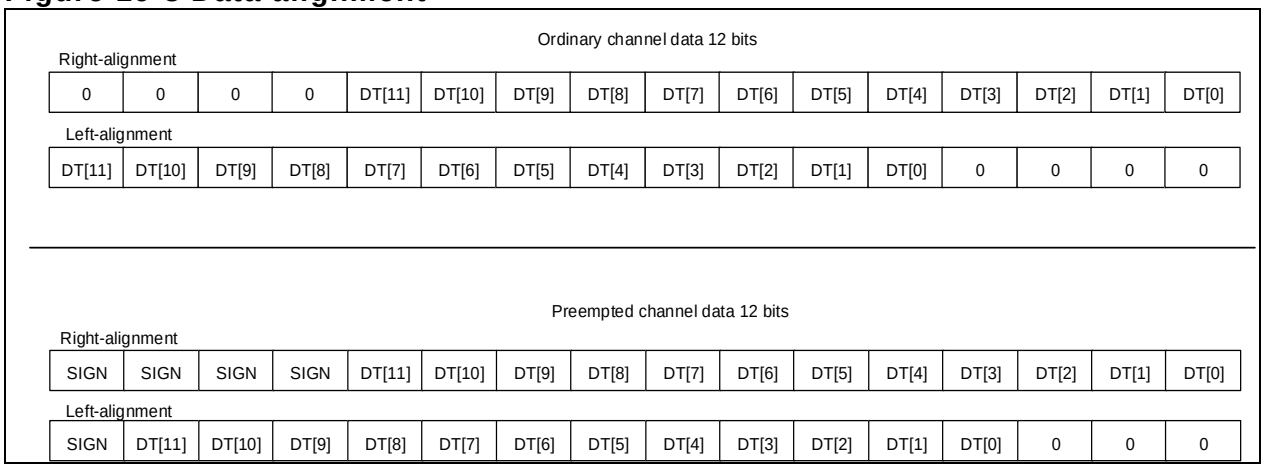
19.4.4 Data management

At the end of the conversion of the ordinary group, the converted value is stored in the ADC_ODT register. Once the preempted group conversion ends, the converted data of the preempted group is stored in the ADC_PDTx register.

19.4.4.1 Data alignment

DTALIGN bit in the ADC_CTRL2 register selects the alignment of data (right-aligned or left-aligned). Apart from this, the converted data of the preempted group is decreased by the offset written in the ADC_PCDTOx register. Thus the result may be a negative value, marked by SIGN, as shown in *Figure 19-9*.

Figure 19-8 Data alignment



19.4.4.2 Data read

Read access to the ADC_ODT register using CPU or DMA gets the converted data of the ordinary group. Read access to the ADC_PDTx register using CPU gets the converted data of the preempted group.

When the OCDMAEN is set in the ADC_CTRL2 register, the ADC will issue DMA requests each time when the ADC_OTD register is updated.

ADC1 has its own DMA channels. In Master/Slave mode, the ADC2 as slave can be read by DMA through the master ADC1.

19.4.5 Voltage monitoring

OCVMEN bit or PCVMEN bit in the ADC_CTRL1 register is used to enable voltage monitoring. The VMOR bit will be set if the converted result is outside the high threshold (ADC_VMHB register) or is less than the low threshold (ADC_VMLB register).

VMSGEN bit in the ADC_CTRL1 register is used to enable voltage monitor on either a single specific channel or all the channels. The VMCSEL bit is used to select the specific channel that requires voltage monitoring.

Voltage monitoring is based on the comparison result between the original converted data and the 12-bit voltage monitor boundary register, irrespective of the PCDTOx and DTALIGN bits.

19.4.6 Status flag and interrupts

Each of the ADCs has its dedicated ADCx_STS reisters, that is, OCCS (ordinary channel conversion start flag), PCCS (preempted channel conversion start flag), PCCE (preempted channel conversion end flag), CCE (channel conversion end flag) and VMOR (voltage monitor out of range).

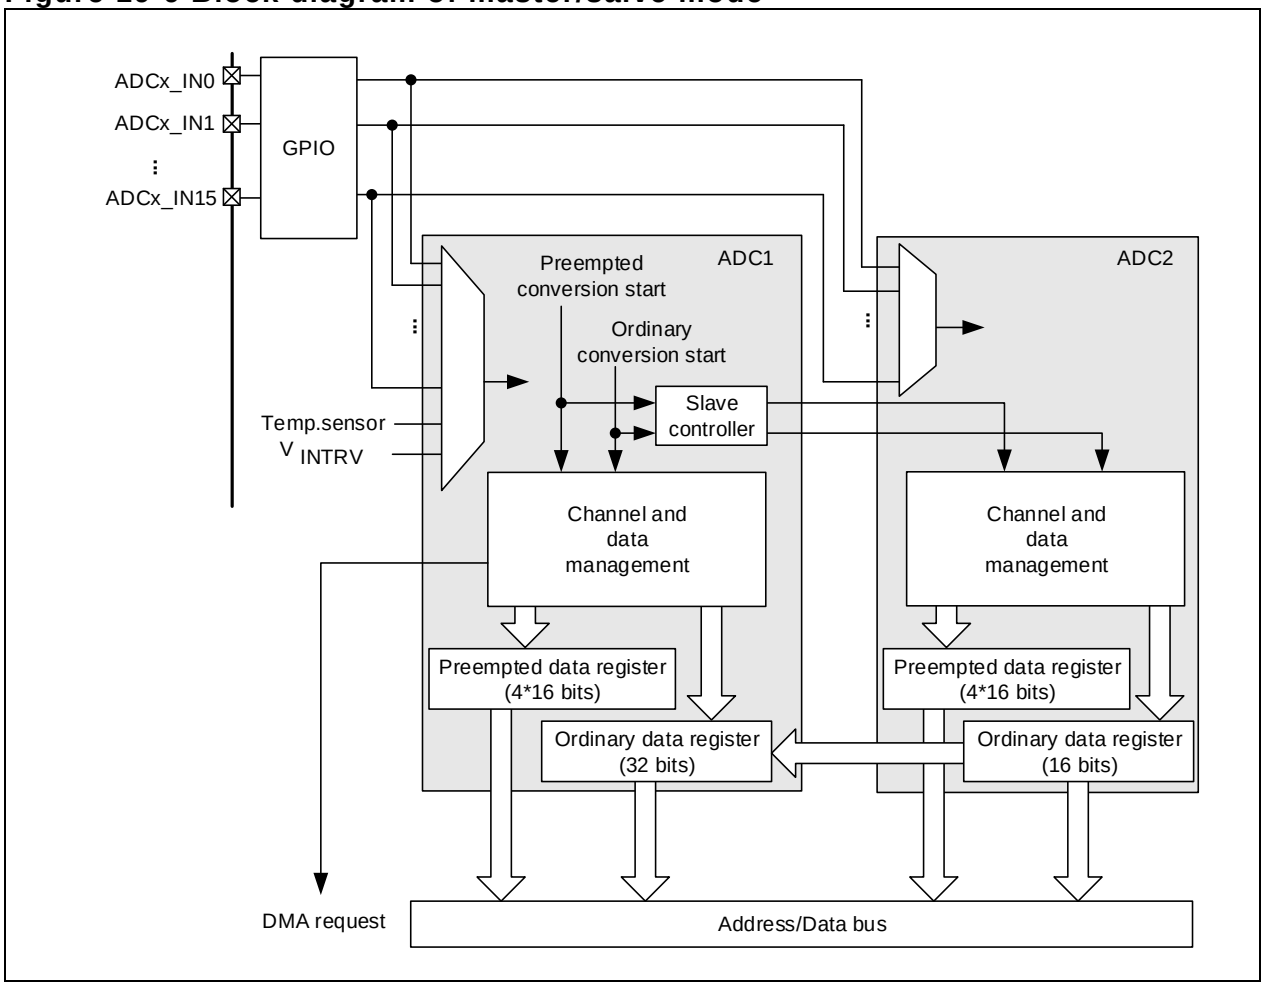
PCCE, CCE and VMOR have their respective interrupt enable bits. Once the interrupt bits are enabled, the corresponding flag is set and an interrupt is sent to CPU. ADC1 shares an interrupt vector with ADC2.

19.5 Master/Slave mode

If Master/Slave mode is enabled, the master is triggered to work with the slave to do the channel conversion. The ADC_ODT register is used as a single interface obtaining the ordinary channel converted data of master/salve ADC.

In this mode, ADC1 acts as a master while ADC2 as a slave. In master/slave mode, master/slave ADC trigger mode must be enabled simultaneously.

Figure 19-9 Block diagram of master/salve mode



19.5.1 Data management

In Master/Slave mode, the data of ordinary channels is also stored in the ADC_ODT register of ADC1. As long as the OCDMAEN is set in the ADC1_CTRL2 register, the ADC1 DMA channel is used to generate a DMA request each time when the data is ready.

19.5.2 Regular simultaneous mode

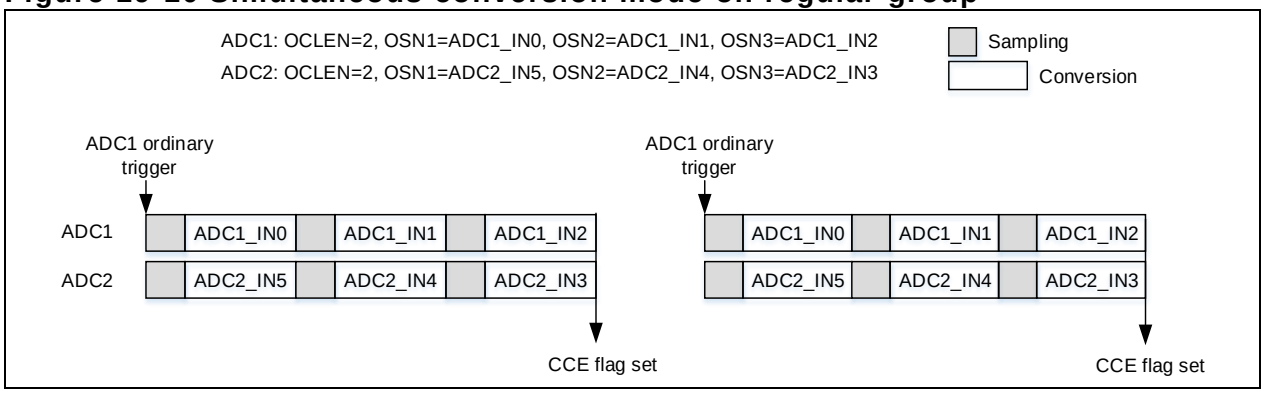
Regular group simultaneous conversion mode

MSSEL bit in the ADC_CTRL1 register is used to select regular group simultaneous conversion mode. When this mode is enabled, is is possible to trigger the regular group of the master to enable simultaneous conversion of the regular group by master and slave. In this mode, it is required to configure the same sampling time and the same sequence length for the master and slave to avoid the loss of data due to the lack of synchronization.

Figure 19-10 shows an example of the regular simultaneous mode

Note: The same channel is not allowed to be sampled by several ADCs simultaneously. Do not put the same channel in the same sequence location of different ADCs.

Figure 19-10 Simultaneous conversion mode on regular group

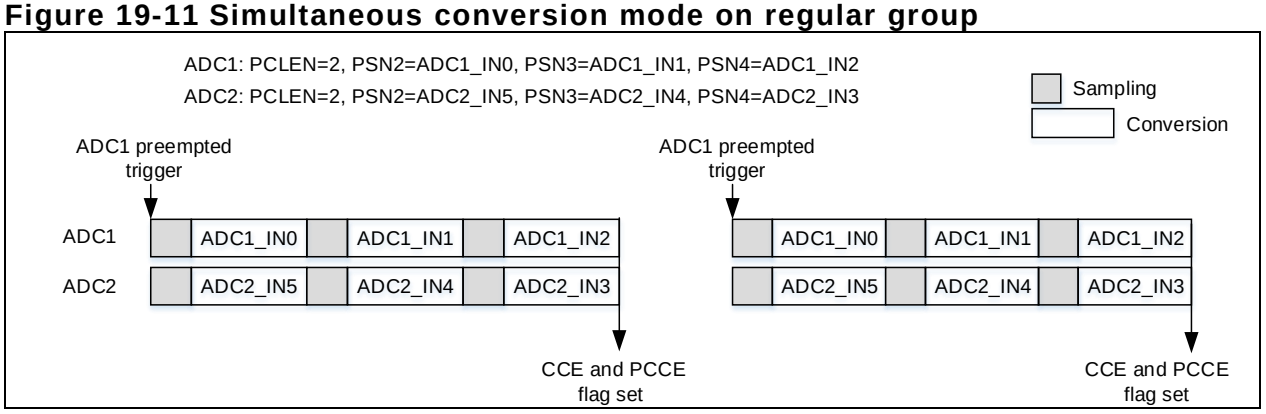


Preempted group simultaneous conversion mode

MSSEL bit in the ADC_CTRL1 register is used to select preempted group simultaneous conversion mode. When this mode is enabled, it is possible to trigger the preempted group of the master to enable simultaneous conversion of the preempted group by master and slave. *Figure 19-10* shows an example of the preempted group simultaneous conversion mode.

Note: The same channel is not allowed to be sampled by several ADCs simultaneously. Do not put the same channel in the same sequence location of different ADCs.

Figure 19-11 Simultaneous conversion mode on regular group



Combined regular/preempted simultaneous conversion mode

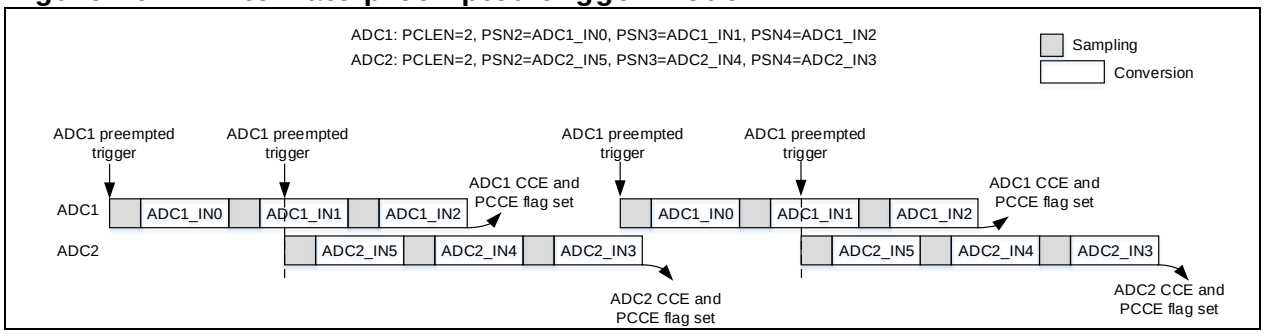
MSSEL bit in the ADC_CTRL1 register is used to select combined trigger mode (regular group simultaneous conversion, and preempted group simultaneous conversion). When this mode is enabled, it is possible to trigger the regular channels of the master to enable simultaneous conversion of regular group by master and slave or to trigger the preempted group of the master to enable simultaneous conversion of the preempted group by master and slave.

19.5.3 Interleaved trigger mode of preempted group

Interleaved trigger mode of preempted group

MSSEL bit in the ADC_CTRL1 register selects the interleaved preempted-group trigger mode. When this mode is enabled, the preempted channels of the master can be triggered continuously so that the master/slave ADCs convert the preempted channels alternately. *Figure 19-12* shows an example of the alternate preempted trigger mode.

Figure 19-12 Alternate preempted trigger mode



Combined trigger mode (regular group simultaneous conversion + interleaved conversion of preempted group)

MSSEL bit in the ADC_CTRL1 register selects the combined trigger mode (simultaneous regular group conversion by master/slave, and interleaved conversion of preempted group). When this mode is enabled, it is possible to trigger the regular channels of the master so that the master and slave convert the regular group simultaneously, or to trigger the preempted channels of the master several times so that the master/slave convert the preempted group alternately.

If the regular conversion is interrupted by the preempted trigger, the regular conversion of all ADCs is stopped, and one of the ADCs starts the preempted conversion. At this point, the master will ignore the preempted trigger until the regular conversion is resumed.

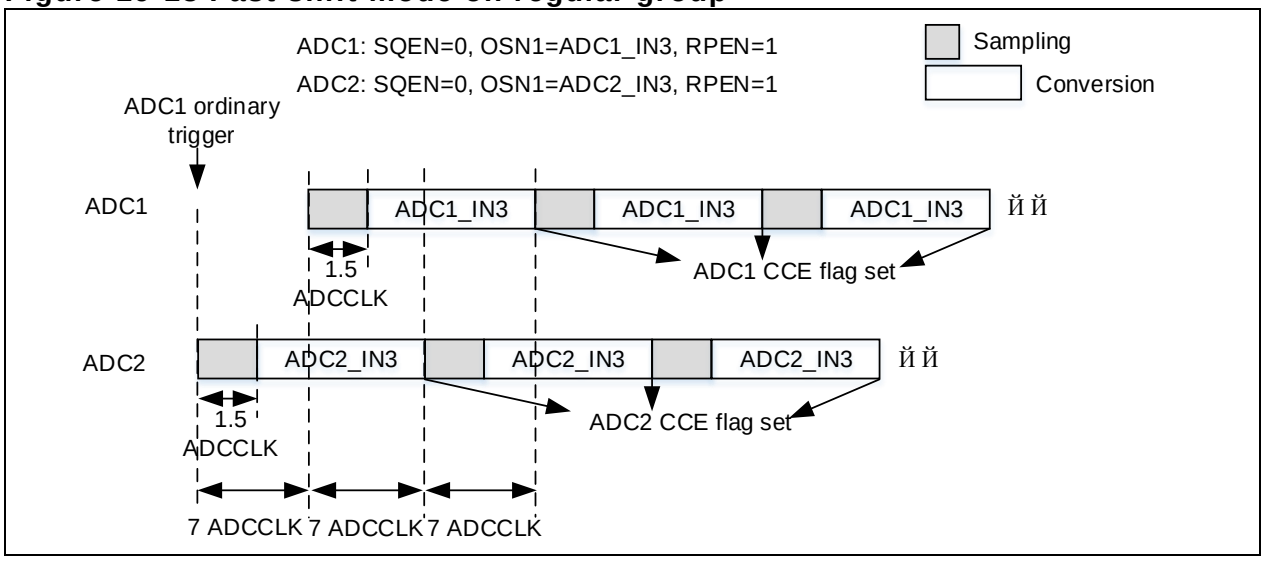
19.5.4 Shift mode of regular group

Fast shift mode on regular group

MSSEL bit in the ADC_CTRL1 register is used to select fast shift mode on regular group. In this mode, after the regular group of the master is triggerred, the conversion interval between ADCs is 7 ADCCLK cycles. e sampling time allowed is 1.5 ADCCLK cycles, as shown in *Figure 19-13*.

Note: The preempted group conversion is not allowed in this mode.

Figure 19-13 Fast shift mode on regular group



Combined shift mode (simultaneous preempted-group conversion + fast shift mode on regular group)

MSSEL bit in the ADC_CTRL1 register is used to select mixed shift mode (simultaneous preempted group converion+ fast shift mode on regular group). In this mode, it is possible to trigger the regular group of the master to allow that the conversion interval between ADCs is 7 ADCCLK cycles. It is also possible to trigger the preempted group of the master to enable simultaneous conversion of the preempted group by master/slave.

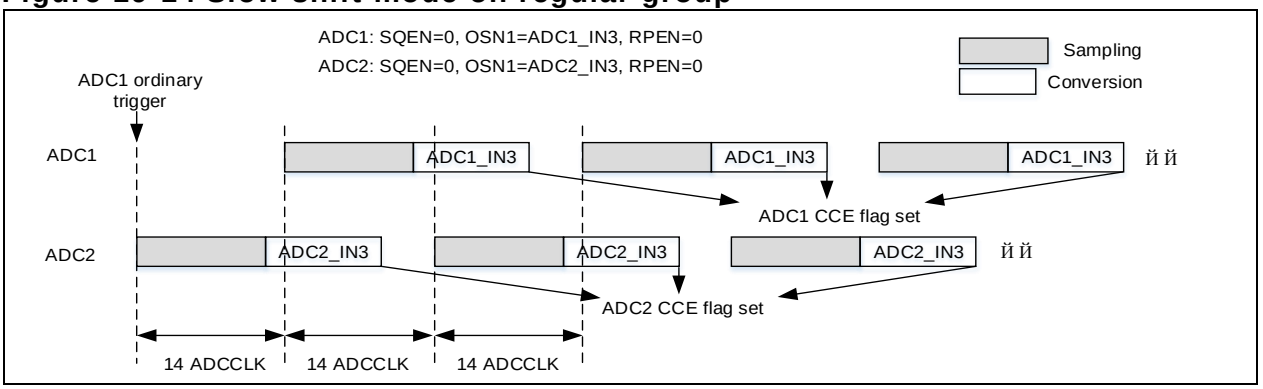
If the regular group conversion is interrupted by the preempted group, the regular group conversion is stopped and resumes from ADC2 at the end of the preempted conversion.

Slow shift mode on regular group

MSSEL bit in the ADC_CTRL1 register is used to select slow switch mode. It is possible to trigger the regular group of the master to allow that the conversion interval between ADCs is 14 ADCCLK cycles. In this mode, the sampling time allowed is less than 14 ADCCLK cycles, as shown in *Figure 19-14*.

Note: The preempted trigger is not allowed in this mode.

Figure 19-14 Slow shift mode on regular group



Combined shift mode (simultaneous preempted-group conversion + slow shift mode on regular group)

MSSEL bit in the ADC_CTRL1 register is used to select mixed shift mode (simultaneous preempted-group conversion+ slow shift mode on regular group). In this mode, it is possible to trigger the regular group of the master to allow that the conversion interval between ADCs is 14 ADCCLK cycles. It is also possible to trigger the preempted group of the master to enable simultaneous conversion of the preempted group by master/slave.

If the regular group conversion is interrupted by the preempted group, the regular group conversion is stopped and resumes from ADC2 at the end of the preempted conversion.

19.6 ADC registers

Table 19-2 lists ADC register map and their reset values.

These peripheral registers must be accessed by word (32 bits).

Table 19-2 ADC register map and reset values

Register	Offset	Reset value
ADC_STS	0x000	0x0000 0000

Bit	Register	Reset value	Type	Description
Bit 31: 12	Reserved	0x00000	resd	Kept at its default value
Bit 11: 0	VMHB	0xFFF	rw	Voltage monitoring high boundary

19.6.8 ADC voltage monitor low threshold register (ADC_VWLB)

Accessible: word.

Bit	Register	Reset value	Type	Description
Bit 31: 12	Reserved	0x00000	resd	Kept at its default value
Bit 11: 0	VMLB	0xFFF	rw	Voltage monitoring low boundary

19.6.9 ADC ordinary sequence register 1 (ADC_OSQ1)

Accessible: word.

Bit	Register	Reset value	Type	Description
Bit 31: 24	Reserved	0x00	resd	Kept at its default value
Bit 23: 20	OCLEN	0x0	rw	Ordinary conversion sequence length 0000: 1 conversion 0001: 2 conversions …… 1111: 16 conversions
Bit 19: 15	OSN16	0x00	rw	Number of 16th conversion in ordinary sequence
Bit 14: 10	OSN15	0x00	rw	Number of 15th conversion in ordinary sequence
Bit 9: 5	OSN14	0x00	rw	Number of 14th conversion in ordinary sequence

Bit 4: 0	OSN13	0x00	rw	Number of 13th conversion in ordinary sequence Note: The number can be from 0 to 17. For example, if the number is set to 3, it means that the 13th conversion is ADC_IN3 channel.

19.6.10 ADC ordinary sequence register 2 (ADC_OSQ2)

Accessible: word.

Bit	Register	Reset value	Type	Description
Bit 31: 30	Reserved	0x0	resd	Kept at its default value
Bit 29: 25	OSN12	0x00	rw	Number of 12th conversion in ordinary sequence
Bit 24: 20	OSN11	0x00	rw	Number of 11th conversion in ordinary sequence
Bit 19: 15	OSN10	0x00	rw	Number of 10th conversion in ordinary sequence
Bit 14: 10	OSN9	0x00	rw	Number of 9th conversion in ordinary sequence
Bit 9: 5	OSN8	0x00	rw	Number of 8th conversion in ordinary sequence
Bit 4: 0	OSN7	0x00	rw	Number of 7th conversion in ordinary sequence Note: The number can be from 0 to 17. For example, if the number is set to 8, it means that the 7th conversion is ADC_IN8 channel.

19.6.11 ADC ordinary sequence register 3 (ADC_OSQ3)

Accessible: word.

Bit	Register	Reset value	Type	Description
Bit 31: 30	Reserved	0x0	resd	Kept at its default value
Bit 29: 25	OSN6	0x00	rw	Number of 6th conversion in ordinary sequence
Bit 24: 20	OSN5	0x00	rw	Number of 5th conversion in ordinary sequence
Bit 19: 15	OSN4	0x00	rw	Number of 4th conversion in ordinary sequence
Bit 14: 10	OSN3	0x00	rw	Number of 3rd conversion in ordinary sequence
Bit 9: 5	OSN2	0x00	rw	Number of 2nd conversion in ordinary sequence
Bit 4: 0	OSN1	0x00	rw	Number of 1st conversion in ordinary sequence Note: The number can be from 0 to 17. For example, if the number is set to 8, it means that the 1st conversion is ADC_IN17 channel.

19.6.12 ADC preempted sequence register (ADC_PSQ)

Accessible: word.

Bit	Register	Reset value	Type	Description
Bit 31: 30	Reserved	0x0	resd	Kept at its default value
Bit 21: 20	PCLEN	0x0	rw	Preempted conversion sequence length 00: 1 conversion 01: 2 conversions 10: 3 conversions 11: 4 conversions
Bit 19: 15	PSN4	0x00	rw	Number of 4th conversion in preempted sequence
Bit 14: 10	PSN3	0x00	rw	Number of 3rd conversion in preempted sequence
Bit 9: 5	PSN2	0x00	rw	Number of 2nd conversion in preempted sequence

Bit 4: 0	PSN1	0x00	rw	Number of 1st conversion in preempted sequence Note: The number can be from 0 to 17. For example, if the number is set to 3, it refers to the ADC_IN3 channel. If PCLEN is less than 4, the conversion sequence starts from 4-PCLEN. For example, when ADC_PSQ ([21: 0]) =10 00110 00101 00100 00011, it indicates that the scan conversion follows the sequence : 4, 5, 6, not 3, 4,5.

19.6.13 ADC preempted data register x (ADC_PDTx) (x=1..4)

Accessible: word.

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Kept at its default value
Bit 15: 0	PDTx	0x0000	rw	Conversion data from preempted channel

19.6.14 ADC ordinary data register (ADC_ODT)

Accessible: word.

Bit	Register	Reset value	Type	Description
Bit 31: 16	ADC2ODT	0x0000	ro	ADC2 conversion data of ordinary channel Note: These bits are reserved in ADC2 and ADC3. In ADC1, these bits are valid only in master/slave mode, and they contain the conversion result from the ADC2 ordinary cahnnels.
Bit 15: 0	ODT	0x0000	ro	Conversion data of ordinary channel

20 CAN

20.1 CAN introduction

CAN (Controller Area Network) is a distributed and serial communication protocol for real-time and reliable data communication among various nodes. It supports the CAN protocol version 2.0A and 2.0B.

20.2 CAN main features

- Baud rates up to 1M bit/s
- Supports the time triggered communication
- Interrupt enable and maskable
- Configurable automatic retransmission mode

Transmission

- Three transmit mailboxes
- Configurable transmit priority
- Supports the time stamp on transmission

Reception

- Two FIFOs with three-level depth
- 14 filter banks
- Supports the identifier list mode
- Supports the identifier mask mode
- FIFO overrun management

Time triggered communication mode

- 16-bit timers
- Time stamp on transmission

20.3 Baud rate configuration

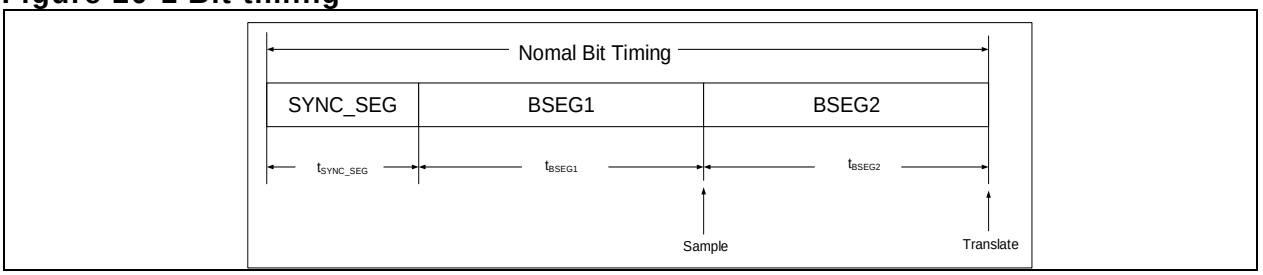
The nominal bit time of the CAN bus consists of three parts as follows:

Synchronization segment (SYNC_SEG): This segment has one time unit, and its time duration is defined by the BRDIV[11: 0] bit in the CAN_BTMG register.

Bit segment 1 (BIT SEGMENT 1): It is referred to as BSEG1 including the PROP_SEG and PHASE_SEG1 of the CAN standard. Its duration is between 1 and 16 time units, defined by the BTS1[3: 0] bit.

Big segment 2 (BIT SEGMENT 2): It is referred to as BSEG2 including the PHASE_SEG2 of the CAN standard. Its duration is between 1 and 8 time units, defined by the BTS2[2: 0] bit.

Figure 20-1 Bit timing



Baud rate formula:

$$BaudRate = \frac{1}{\text{Nomal Bit Timimg}}$$

$$Nomal\ Bit\ Timing = t_{SYNC\_SEG} + t_{BSEG1} + t_{BSEG2}$$

where

$$t_{SYNC\_SEG} = 1\ x\ t_q$$

$$t_{BSEG1} = (1 + \text{BTS1}[3:0]) \text{ x } t_q$$

$$t_{BSEG2} = (1 + \text{BTS2}[2:0]) \text{ x } t_q$$

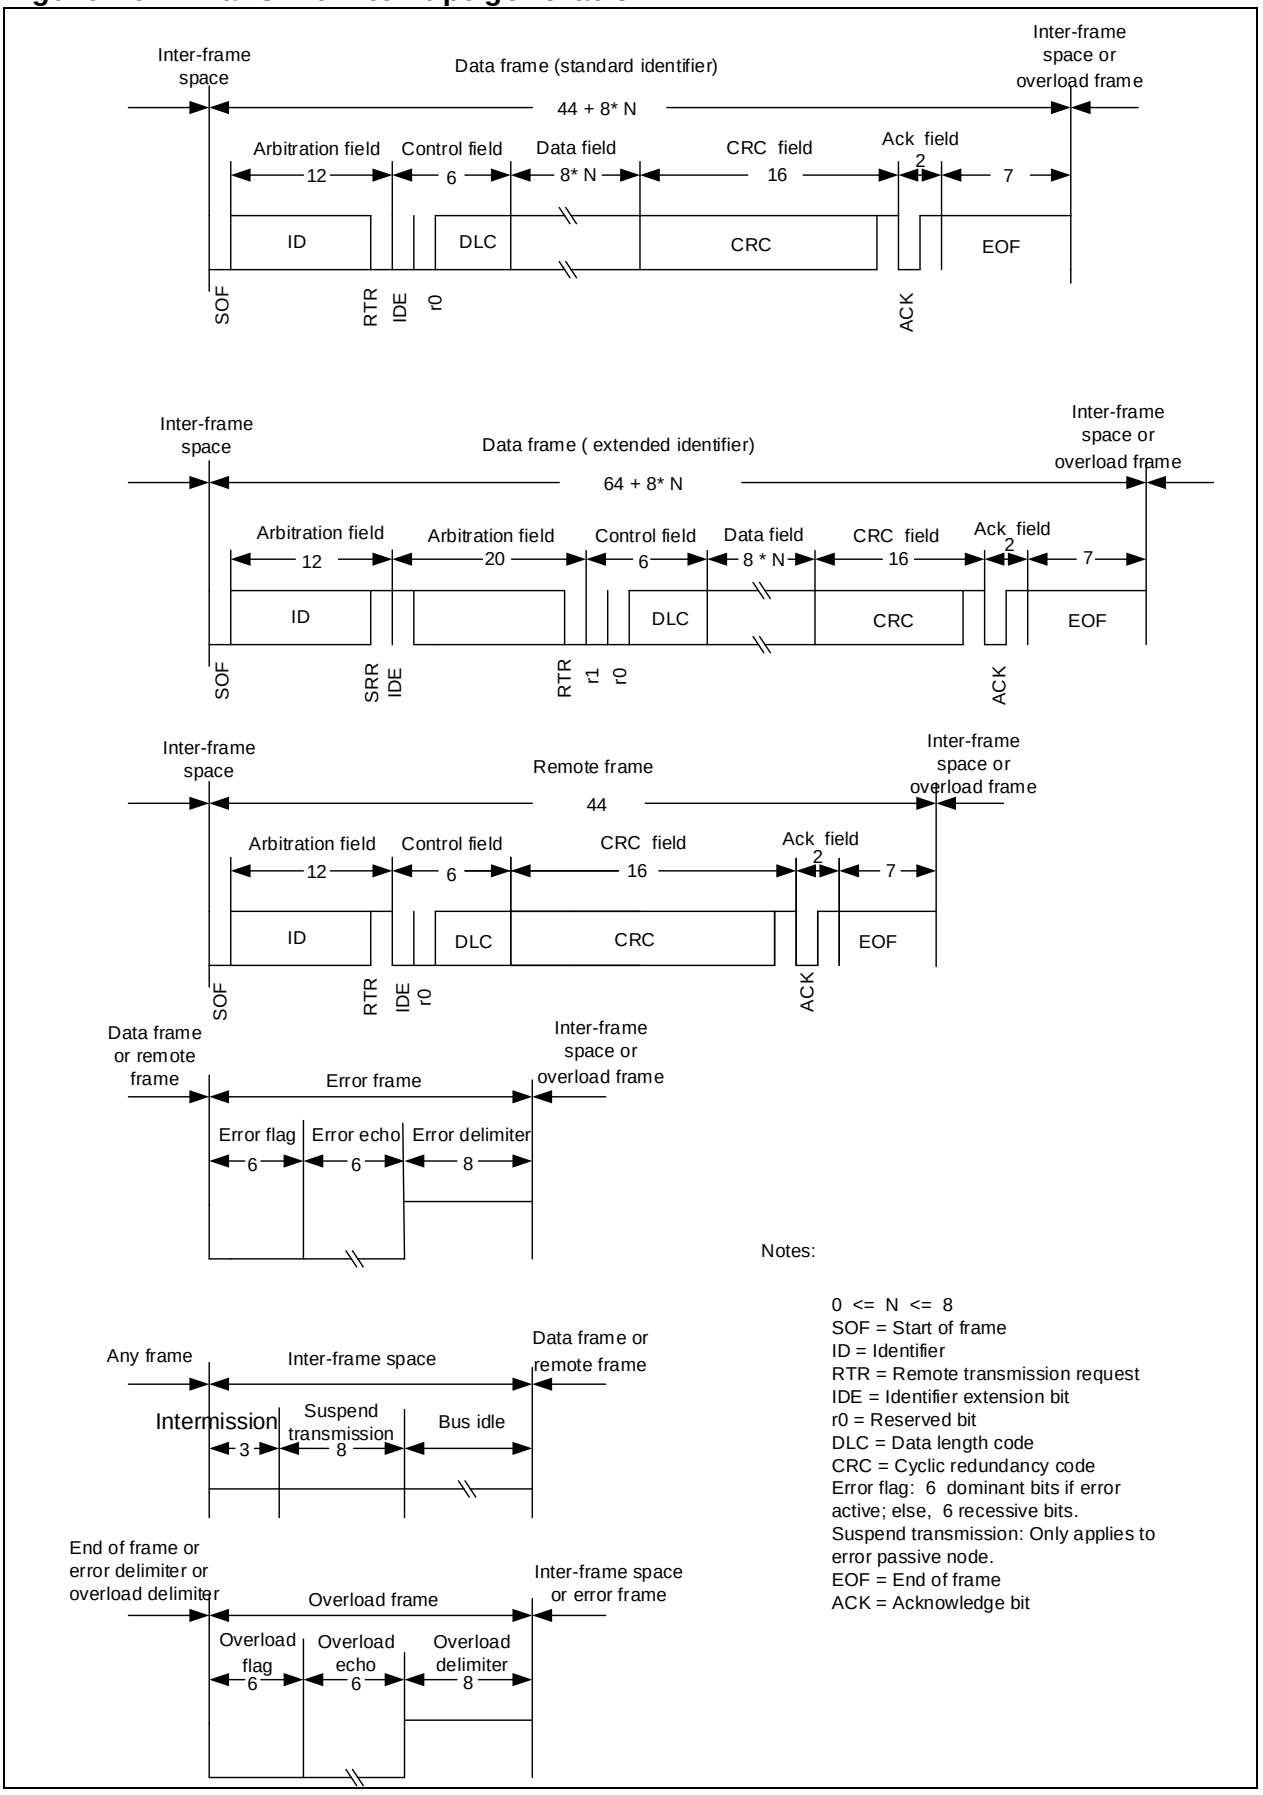
$$t_q = (1 + \text{BRDIV}[11:0]) \text{ x } t_{pclk}$$

Hard synchronization and re-synchronization

The start location of each bit in CAN nodes is always in synchronization segment by default, and the sampling is performed at the edge location of bit segment 1 and big segment 2 simulatenously.

During the actual transmission, each bit of the CAN nodes has certain phase error due to the oscillator drift, transmission delay among the network nodes and noise interference. To avoid the impact on the communication, the edge of Start of Frame and its subsequent falling edge can be hard synchronized or resynchronized. The time length of the synchronization compensation can not be greater than the resynchronization width (1 to 4 time units, defined by the RSAW[1: 0] bit).

Figure 20-2 Transmit interrupt generation



Notes:

0 <= N <= 8
SOF = Start of frame
ID = Identifier
RTR = Remote transmission request
IDE = Identifier extension bit
r0 = Reserved bit
DLC = Data length code
CRC = Cyclic redundancy code
Error flag: 6 dominant bits if error active; else, 6 recessive bits.
Suspend transmission: Only applies to error passive node.
EOF = End of frame
ACK = Acknowledge bit

20.4 Interrupt management

The CAN controller contains four interrupt vectors. The interrupts can be enabled or disabled by setting the CAN_INTEN register.

Figure 20-3 Transmit interrupt generation

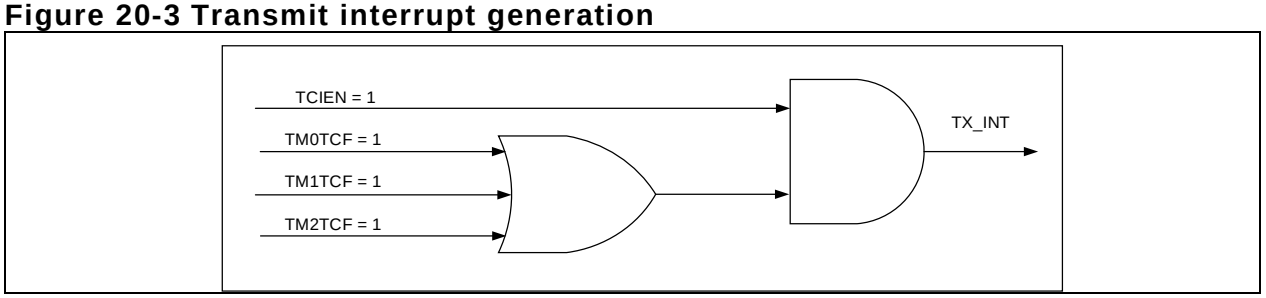


Figure 20-4 Receive interrupt 0 generation

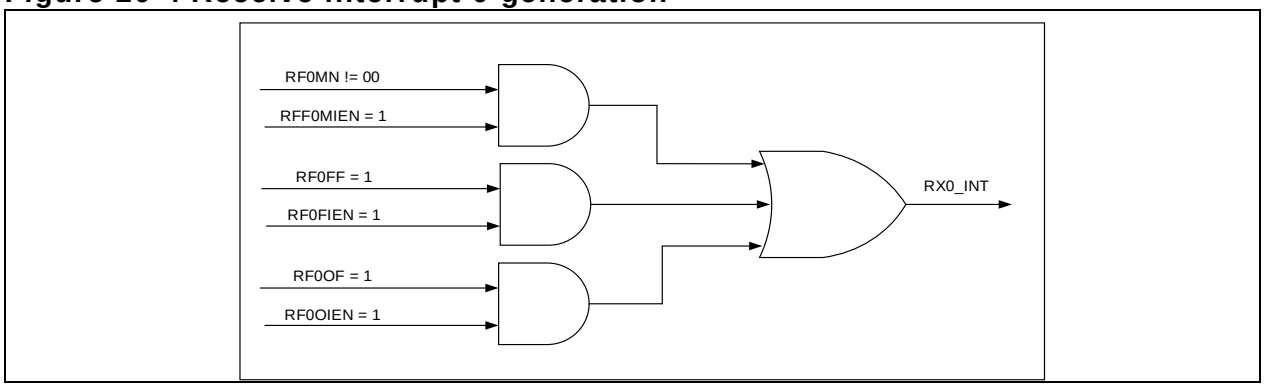

Figure 20-5 Receive interrupt 1 generation

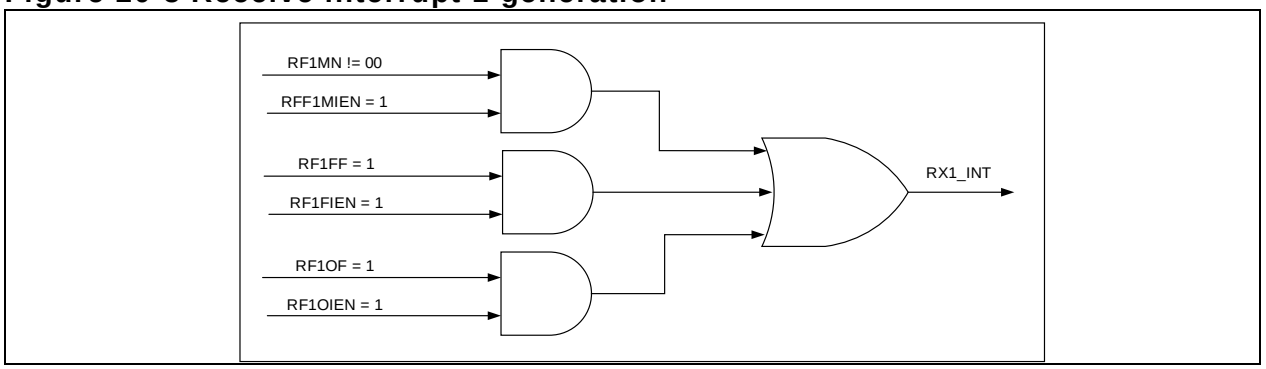

Figure 20-6 Status error interrupt generation

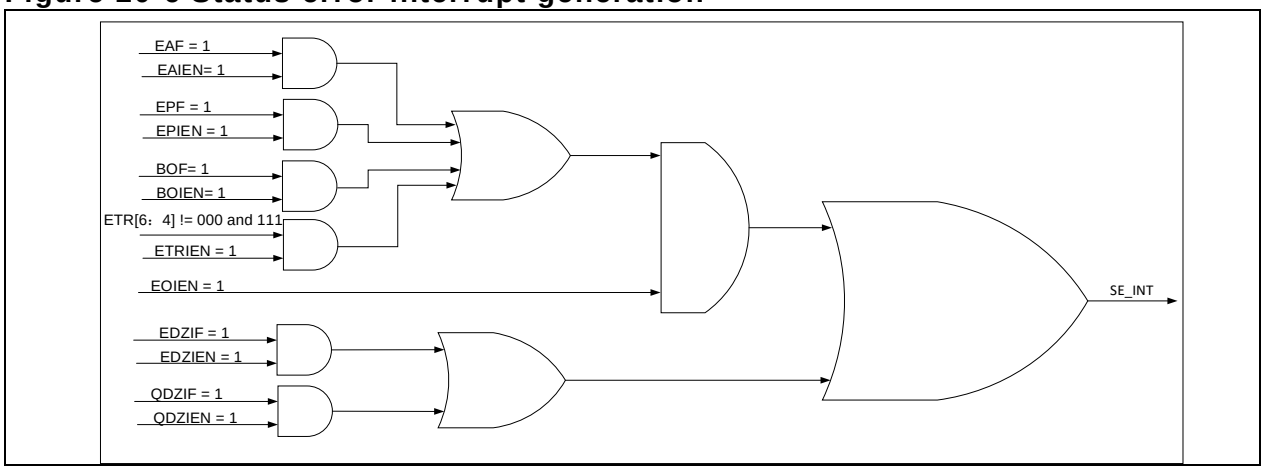


20.5 Design tips

The following information can be used as reference for CAN application development:

- **Debug control**
  When the system enters the debug mode, the CAN controller stops or continues to work normally, depending on the CANx_PAUSE bit in the DEBUG_CTRL register or the PTD bit in the CAN_MCTRL register.
- **Time triggered communication**
  The timer triggered communication is used to improve the real-time performance so as to avoid bus competition. It is activated by setting TTCEN=1 in the CAN_MCTRL register. The internal 16-bit timer is incremented each CAN bit time, and is sampled on the Start of Frame bit to generate the time stamp value, which is stored in the CAN_RFCx and CAN_TMCx register.
- **Register access protection**
  The CAN_BTMG register can be modified only when the CAN is in frozen mode.

Although the transmission of incorrect data will not cause problems at the network level, it can have severe impact on the application. Therefore, the register can be modified only when a transmit mailbox is empty.
The filter configuration in the CAN_FMCFG, CAN_FBWCFG and CAN_FRF registers can be modified only when FCS=1. The CAN_FiFBx register can be modified only when FCS=1 or FAENx=0.

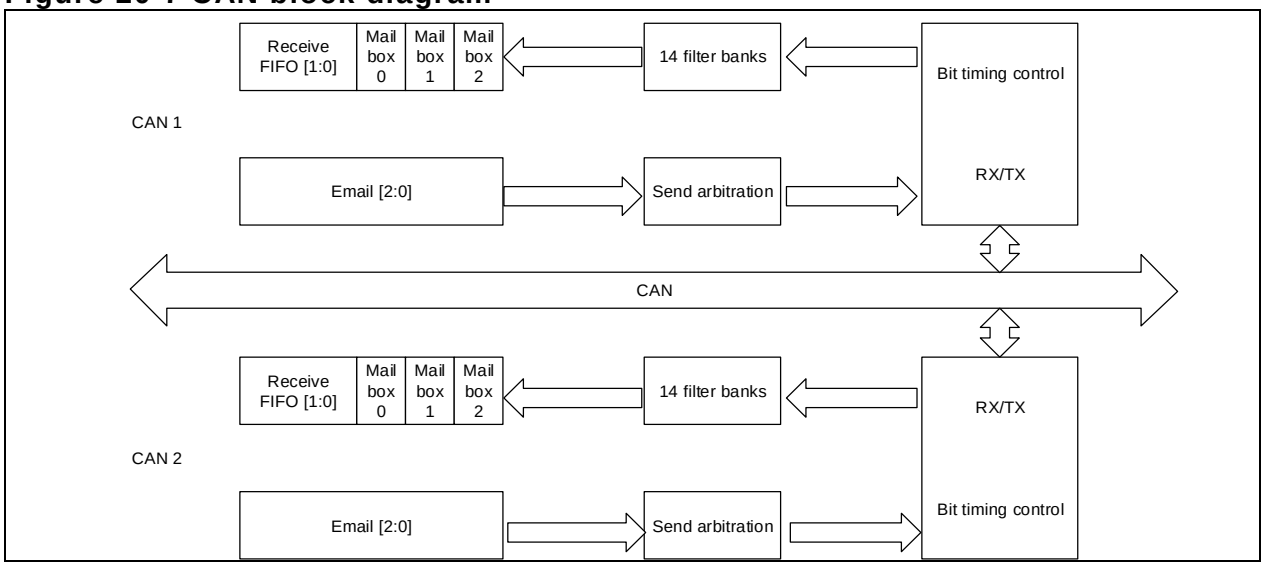
20.6 Function overview

20.6.1 General functional description

As the number of nodes in the CAN network and the number of messages grows, an enhanced filtering mechanism is required to handle all types of meassages in order to reduce the processing time of message reception. A FIFO scheme is used to ensure that the CPU can concentrate on application tasks for a long period of time without the loss of messages. In the meantime, the priority order of the messages to be transmitted is configured by hardware. Standard identifiers (11-bit) and extended identifiers (29-bit) are fully supported by hardware.

Based on the above mentioned conditions, the CAN controller provides 14 scalable/configurable identifier filter banks, 2 receive FIFOs with storing 3 complete messages each and being totally managed by hardware, and 3 transmit mailboxes with their transmit priority order defined by the transmit scheduler.

Figure 20-7 CAN block diagram



20.6.2 Operating modes

The CAN controller has three operating modes:

- **Sleep mode**

  After a system reset, the CAN controller is in Sleep mode. In this mode, the CAN clock is stopped to reduce power consumption and an internal pull-up resistance is disabled. However, the software can still access to the mailbox registers.

  The software requests the CAN controller to enter Sleep mode by setting the DZEN bit in the CAN_MCTRL register. The hardware confirms the request by setting DZC=1 in the CAN_MSTS register.

  Exit Sleep mode in two ways:

  The CAN controller can be woke up by hardware clearing the DZEN bit when the AEDEN bit is set to 1in the CAN_MCTRL register and the CAN bus activity is detected. It can also be woke up by software clearing the DZEN bit.

  Switch from Sleep mode to Frozen mode: The CAN controller switches from Sleep mode to Frozen mode when the FZEN bit is set to 1 in the CAN_MCTRL register and the DZEN bit is cleared. Such switch operation is confirmed by hardware setting the FZC bit to 1 in the CAN_MSTS register.

  Switch from Sleep mode to Communication mode: The CAN controller enters Communication mode when the FZEN and DZEN bits are both cleared and the CAN controller has synchronized with the bus. In other words, it must wait for 11 consecutive recessive bits to be detected on the CANRX pin.

- **Frozen mode**

  The CAN controller initialization can be done by software only in Frozen mode, including the CAN_BTMG and CAN_MCTRL registers. But the 14 CAN filter banks (mode, scale, FIFO association, activation and filter values) can be initialized in non-Frozen mode. When the CAN controller is in Frozen mode, message reception and transmission are both disabled.

  Switch from Frozen mode to Communication mode: The CAN controller leaves Frozen mode when the FZEN bit is cleared in the CAN_MCTRL register. This switch operation is confirmed by hardware clearing the FZC bit in the CAN_MSTS register. The CAN controller must be synchronized with the bus.

  Switch from Communication mode to Sleep mode: The CAN controller enters Sleep mode if DZEN=1 and FZEN=0 in the CAN_MCTRL register. This switch operation is confirmed by hardware setting the DZC bit in the CAN_MSTS register.

- **Communication mode**

  After the CAN_BTMG and CAN_MCTRL registers are configured in Frozen mode, the CAN controller enters Communication mode and is ready for message reception and transmission.

  Switch from Communication mode to Sleep mode: The CAN controller switches to Sleep mode when the DZEN bit is set in the CAN_MCTRL register and the current CAN bus transmission has been complete.

  Switch from Communication mode to Frozen mode: The CAN controller enters Frozen mode when the FZEN bit is set in the CAN_MCTRL register and the current CAN bus transmission has been complete.

20.6.3 Test modes

The CAN controller defines three test modes, including Listen-only mode, Loop back mode and combined Listen-only and Loop back mode. Test mode can be selected by setting the LOEN and LBEN bits in the CAN_BTMG register.

- Listen-only mode is selected when the LOEN bit is set in the CAN_BTMG register. In this mode, the CAN is able to receive data, but only recessive bits are output on the CANTX pin. In the meantime, the dominant bits output on the CANTX can be monitored by the receive side but without affecting the CAN bus.

- Loop back mode is selected by setting the LBEN bit in the CAN_BTMG register. In this mode, The CAN only receives the level signal on its CANTX pin. Meanwhile, the CAN can also send data to the external bus. The Loop back mode is mainly used for self-test functions.
- It is possible to enable both the Listen-only and Loop back mode by setting the LOEN and LBEN bits in the CAN_BTMG register. In this case, the CAN is disconnected from the bus network, the CANTX pin remains in recessive state, and the transmit side is connected to the receive side.

20.6.4 Message filtering

The received message has to go through filtering by its identifier. If passed,the message will be stored in the correspoinding FIFOs. If not, the message will be discarded. The whole operation is done by hardware without using CPU resources.

Filter bit width

The CAN controller provides 14 configurable and scalable filter banks (0~13). Each filter bank has two 32-bit registers, CAN_FiFB1 and CAN_FiFB. The filter bit width can be configured as two 16 bits or one 32 bits, depending on the corresponding bits in the CAN_FBWCFG register.

32-bit fliter register CAN_FiFBx includes the SID[10: 0], EID[17: 0], IDT and RTR bits.

CAN_FiFB1[31: 21]	CAN_FiFB1[20: 3]	CAN_FiFB1[2: 0]		
CAN_FiFB2[31: 21]	CAN_FiFB2[20: 3]	CAN_FiFB2[2: 0]		
SID[10：0]/EID[28: 18]	EID[17: 0]	IDT	RTR	0

Two 16-bit filter register CAN_FiFBx includes SID[10: 0], IDT, RTR and EID[17: 15] bits

CAN_FiFB1[31: 21]	CAN_FiFB1 [20: 19]	CAN_FiFB1 [18: 16]	CAN_FiFB1[15: 5]	CAN_FiFB1 [4: 3]	CAN_FiFB1 [2: 0]	
CAN_FiFB2[31: 21]	CAN_FiFB2 [20: 19]	CAN_FiFB2 [18: 16]	CAN_FiFB2[15: 5]	AN_FiFB2 [4: 3]	CAN_FiFB2 [2: 0]	
SID[10: 0]	IDT	RTR	EID[17: 15]	SID[10: 0]	IDT	RTR	EID[17: 15]

Filtering mode

The filter register can be configured in identifier mask mode or in identifier list mode by setting the FMSELx bit in the CAN_FMCFG register. The mask mode is used to specify which bits must match the pre-programmed identifiers, and which bits do not need. In identifier list mode, the identifier must match the pre-programmed identifier. The two modes can be used in conjunction with filter width to deliver four filtering modes below:

Figure 20-8 32-bit identifier mask mode

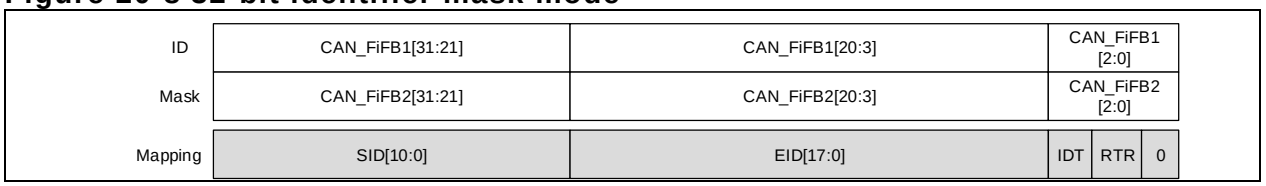


Figure 20-9 32-bit identifier list mode

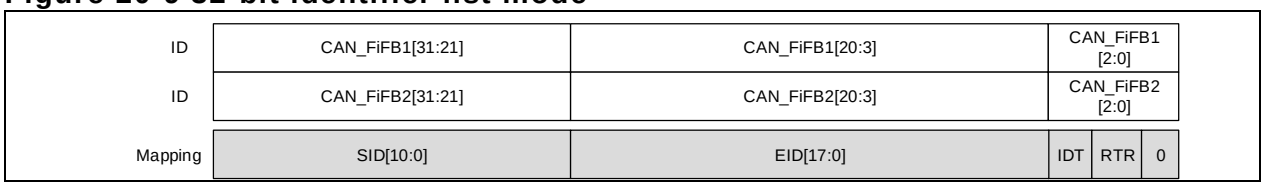

Figure 20-10 16-bit identifier mask mode

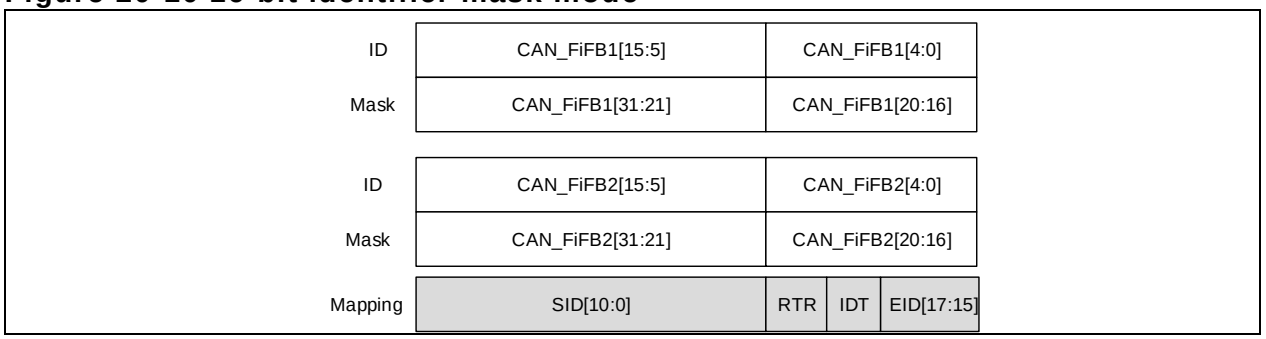

Figure 20-11 16-bit identifier list mode

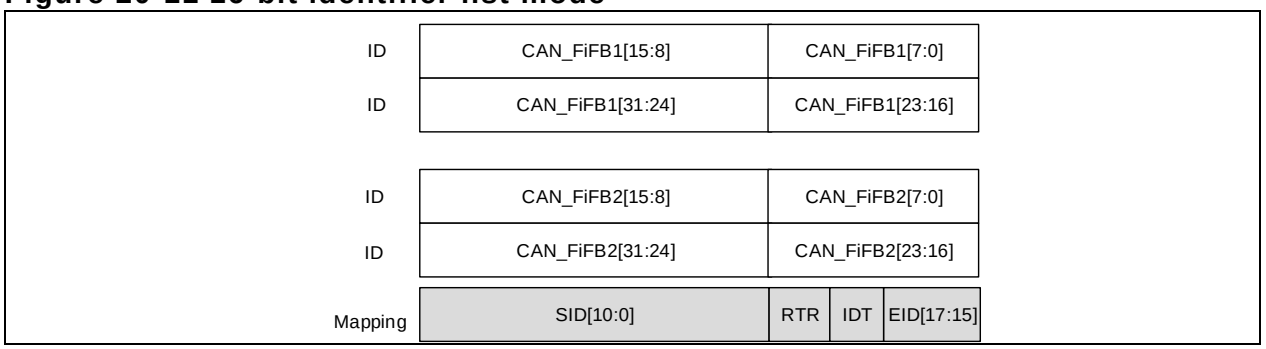


Filter match number

14 filter banks have different filtering effects dependent on the bit width mode. For example, 32-bit identifier mask mode contains the filters numbered n while 16-bit identifier list mode contains the filters numbered n, n+1, n+2 and n+3. When a frame of message passes through the filter number N, the number N is stored in the RFFMN[7: 0] bit in the CAN_RFCx register. The distribution of the filter number does not take into account the activation state of the filter banks.

The table below shows examples of filter numbering

Filter bank	FIFO0	Active	Filter number
0	CAN_F0FB1[31: 0]-ID	Yes	0
	CAN_F0FB2[31: 0]-ID		1
1	CAN_F1FB1[15: 0]-ID	Yes	2
	CAN_F1FB1[31: 16]-ID		3
	CAN_F1FB2[15: 0]-ID		4
	CAN_F1FB2[31: 16]-ID		5
2	CAN_F2FB1[31: 0]-ID	Yes	6
	CAN_F2FB2[31: 0]-Mask		
6	CAN_F6FB1[15: 0]-ID	No	7
	CAN_F6FB1[31: 16]-Mask		
	CAN_F6FB2[15: 0]-ID		8
	CAN_F6FB2[31: 16]-Mask		
9	CAN_F9FB1[31: 0]-ID	No	9
	CAN_F9FB2[31: 0]-ID		10
10	CAN_F10FB1[15: 0]-ID	Yes	11
	CAN_F10FB1[31: 16]-Mask		
	CAN_F10FB2[15: 0]-ID		12

Filter bank	FIFO1	Active	Filter number
3	CAN_F3FB1[15: 0]-ID	Yes	0
	CAN_F3FB1[31: 16]-ID		1
	CAN_F3FB2[15: 0]-ID		2
	CAN_F3FB2[31: 16]-ID		3
4	CAN_F4FB1[31: 0]-ID	Yes	4
	CAN_F4FB2[31: 0]-Mask		
5	CAN_F5FB1[15: 0]-ID	No	5
	CAN_F5FB1[31: 16]-Mask		
	CAN_F5FB2[15: 0]-ID		6
	CAN_F5FB2[31: 16]-Mask		
7	CAN_F7FB1[15: 0]-ID	No	7
	CAN_F7FB1[31: 16]-ID		8
	CAN_F7FB2[15: 0]-ID		9
	CAN_F7FB2[31: 16]-ID		10
8	CAN_F8FB1[31: 0]-ID	Yes	11
	CAN_F8FB2[31: 0]-Mask		
11	CAN_F11FB1[31: 0]-ID	Yes	12

	CAN_F10FB2[31: 16]-Mask		
12	CAN_F12FB1[15: 0]-ID	No	13
	CAN_F12FB1[31: 16]-ID		14
	CAN_F12FB2[15: 0]-ID		15
	CAN_F12FB2[31: 16]-ID		16

	CAN_F11FB2[31: 0]-ID		13
13	CAN_F13FB1[15: 0]-ID	Yes	14
	CAN_F13FB1[31: 16]-ID		15
	CAN_F13FB2[15: 0]-ID		16
	CAN_F13FB2[31: 16]-ID		17

Priority rules

When the CAN controller receives a frame of message, the message may pass through severl filters. In this case, the filter match number stored in the receive mailbox is determined according to the following priority rules:

- A 32-bit filter has priority over a 16-bit filter
- For filters with identical bit width, the identifier list mode has priority over the identifier mask mode
- For filter with identical bit width and identifier mode, the lower number has priority over the higher number.

Filter configuration

- The CAN filter can be configured by setting the FCS=1 in the CAN_FCTRL register.
- Identifier mask mode or identifier list mode can be selected by setting the FMSELx bit in the CAN_FMCFG register.
- The filter bit width can be configured as two 16 bits or one 32 bits by setting the FBWSELx bit in the CAN_FBWCFG register.
- The filter x is associated with FIFO0 or FIFO1 by writing the FRFSELx bit in the CAN_FRF register.
- The filter banks x are activated by setting FAENx=1 in the CAN_FACFG register.
- Configure 0~13 filter banks by writing to the CAN_FiFBx register (i=0…13; x=1,2).
- Complete the CAN filter configuration by setting FCS=0 in the CAN_FCTRL register.

20.6.5 Message transmission

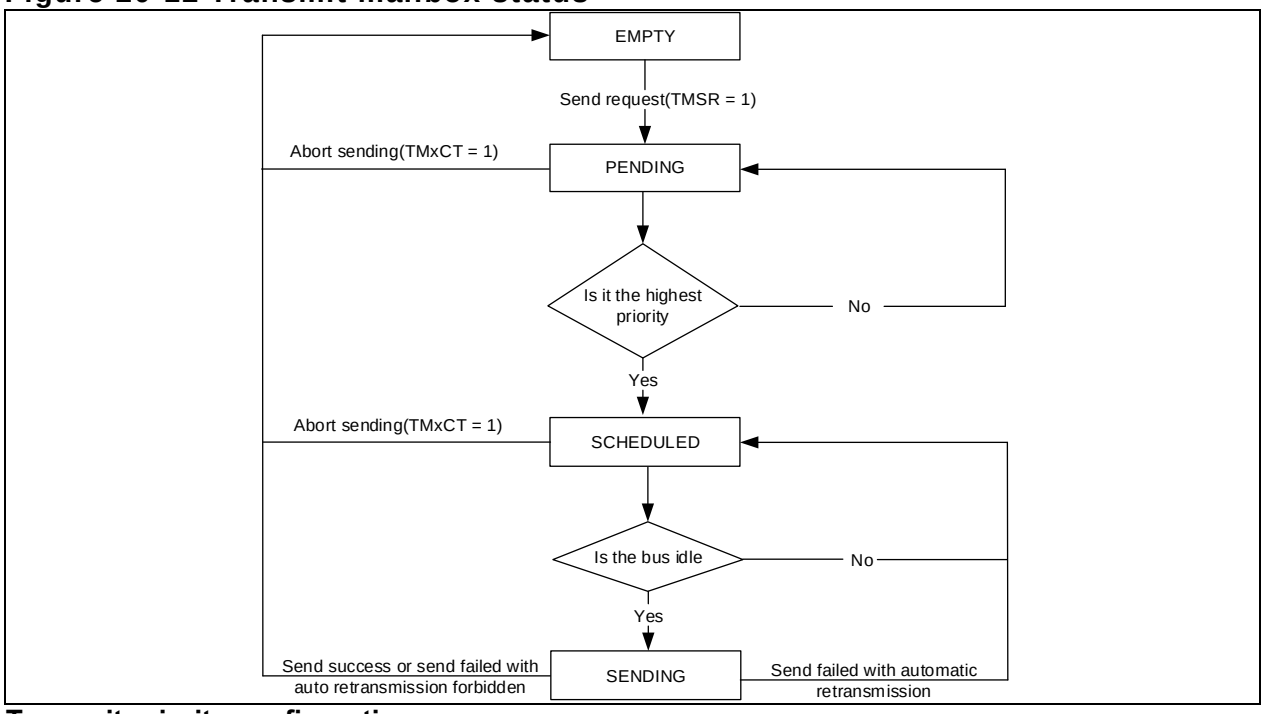
Register configuration

To transmit a message, it is necessary to select one transmit mailbox and configure it through the CAN_TMIx, CAN_TMCx, CAN_TMDTLx and CAN_TMDTHx registers. Once the mailbox configuration is complete, setting the TMSR bit in the CAN_TMIx register can initiate CAN transmission.

Message transmission

The mailbox enters pending state immediately after the mailbox is configured and the CAN controller receives the transmit request. At this point, the CAN controlle will confirm whether the mailbox is given the highest priority or not. If yes, it will enter SCHEDULED STATE, otherwise, it will wait to get the highest priority. The mailbox in SCHEDULED state will monitor the CAN bus state so that the messages in SCHEDULED mailbox can be transmitted as soon as the CAN bus becomes idle. The mailbox will enter EMPTY state at the end of the message transmission.

Figure 20-12 Transmit mailbox status



Transmit priority configuration

When two or more transmit boxes are in PENDING state, their transmit priority must be given.

By identifier: When MMSSR=0 in the CAN_MCTRL register, the transmit order is defined by the identifier of the message in the mailbox. The message with lower identifier value has the highest priority. If the identifier values are the same, the message with lower mailbox number will be transmitted first.

By transmit request order: When MMSSR=1 in the CAN_MCTRL register, the transmit priority is given by the transmit request order of mailboxes.

Transmit status and error status

The TMxTCF, TMxTSF, TMxALF, TMxTEF and TMxEF bits in the CAN_TSTS register are used to indicate transmit status and error status.

TMxTCF bit: Transmission complete flag, indicating that the data transmission is complete when TMxTCF=1.

TMxTSF bit: Transmission success flag, indicating that the data has been transmitted successfully when TMxTSF =1.

TMxALF bit: Transmission arbitration lost flag, indicating that the data transmission arbitration is lost when TMxALF=1.

TMxTEF bit: Transmission error flag, indicating that the data transmission failed due to bus error, and an error frame is sent when TMxTEF=1.

TMxEF bit: Mailbox empty flag, indicating that the data transmission is complete and the mailbox becomes empty when TMxEF=1.

Transmit abort

The TMxCT bit is set in the CAN_TSTS register to abort the transmission of the current mailbox, detailed as follows:

When the current transmission fails or arbitration is lost, if the automatic retransmission mode is disabled, the tranmist mailbox become EMPTY; if the automatic retransmission mode is enbled, the tranmist mailbox becomes SCHEDULED, the mailbox transmission then is aborted and becomes EMPTY.

When the current transmission is complete successfully, the mailbox becomes EMPTY.

20.6.6 Message reception

Register configuration

The CAN_RFIx, CAN_RFCx, CAN_RFDTLx and CAN_RFDTHx registers can be used by user applications to obtain valid messages.

Message reception

The CAN controller boasts two FIFO with three levels to receive messages. FIFO rule is adopted. When the message is received correctly and has passed the identifier filtering, it is regarded as a valid message and is stored in the corresponding FIFO. The number of the received messages RFxMN[1: 0] will be incremented by one whenever the receive FIFO receives a valid message. If a valid message is received when RFxMN[1: 0]=3, the controller will select either to overwrite the previous messages or discard the new incoming message through the MDRSEL bit in the CAN_MCTRL register.

In the meantime, when the user reads a frame of message and the RFxR is set in the CAN_RFx register, one FIFO mailbox is released, and RFxMN[1: 0] bit is descremented by one in the CAN_RFx register.

Receive FIFO status

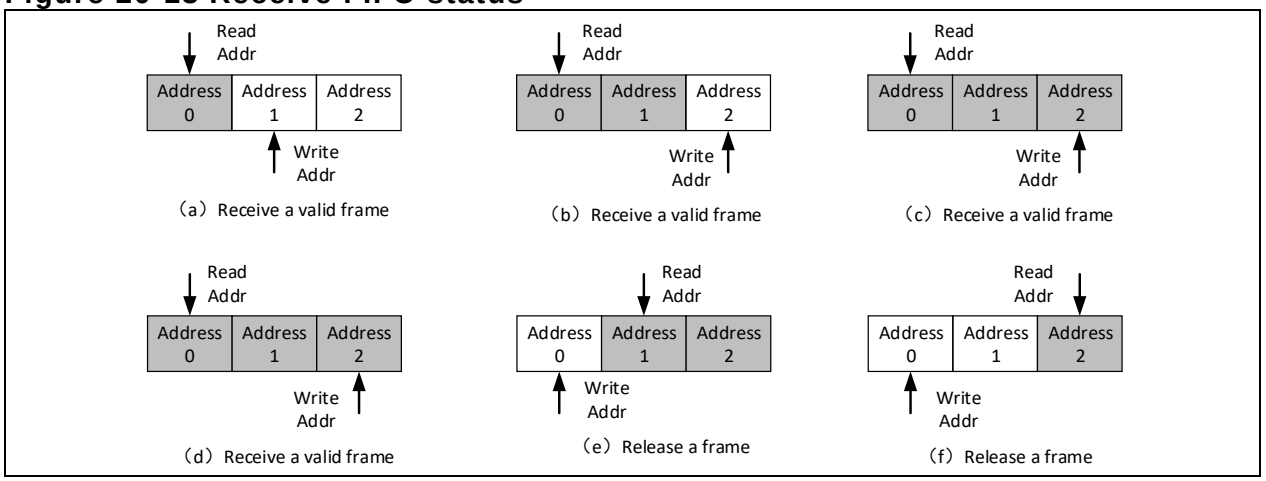
RFxMN[1: 0], RFxFF and RFxOF bits in the RFx register are used to indicate receive FIFO status.

RFxMN[1: 0]: indicates the number of valid messages stored in the FIFOx.

RFxFF: indicates that three valid messages are stroed in the FIFOx (i.e. the three mailboxes are full), as shown in (c) of Figure 20-13.

RFxOF: indicates that a new valid message has been received while the FIFOx is full, as shown in (d) of *Figure 20-13*.

Figure 20-13 Receive FIFO status



20.6.7 Error management

The status of CAN nodes is indicated by the receive error counter (TEC) and transmit error counter (REC) bits in the CAN_ESTS register. In the meantime, the ETR[2: 0] bit in the CAN_ESTS register is used to record the last error source, and the corresponding interrupts will be generated when the CAN_INTEN register is enabled.

- Error active flag: When both TEC and REC are lower than 128, the system is in the error active state. An error active flag is set when an error is detected.
- Error passive flag: When either TEC or REC is greater than 127, the system is in the error passive state. An error passive flag is set when an error is detected.
- Bus-off state: The bus-off state is entered when TEC is greater than 255. In this state, it is impossible to transmit and receive messages. The CAN resumes from bus-off state in two ways:

  Option 1: When AEBOEN=0 in the CAN_MCTRL register, in communication mode, the software requests to enter Frozen mode and exit Frozen mode, and CAN will then resume from bus-off state after 128 occurences of 11 consecutive recessive bits have been detected on the CAN RX pin.

  Option 2: When AEBOEN=1 in the CAN_MCTRL register, the CAN will resume from bus-off state automatically after 128 occurrences of 11 consecutive recessive bits have been detected on the CAN RX pin

20.7 CAN registers

These peripheral registers must be accessed by word (32 bits).

20.7.1 CAN control and status registers

20.7.1.1 CAN master control register (CAN_MCTRL)

Bit	Register	Reset value	Type	Description
Bit 31: 17	Reserved	0x0000	resd	Kept at its default value.
Bit 16	PTD	0x1	rw	Prohibit trans when debug 0: Transmission works during debug 1: Transmission is prohibited during debug. Receive FIFO can be still accessible normally. Note: Transmission can be disabled only when PTD and CANx_PAUSE bits in the DEBUG_CTRL register are set simultaneously.
Bit 15	SPRST	0x0	rw1s	Software partial reset 0: Normal 1: Software partial reset Note: SPRST only reset receive FIFO and MCTRL register. The CAN enters Sleep mode after reset. Then this bit is automatically cleared by hardware.
Bit 14: 8	Reserved	0x00	resd	Kept at its default value.
Bit 7	TTCEN	0x0	rw	Time triggered communication mode enable

				0: Time triggered communication mode disabled 1: Time triggered communication mode enabled
Bit 6	AEBOEN	0x0	rw	Automatic exit bus-off enable 0: Automatic exit bus-off disabled 1: Automatic exit bus-off enabled Note: When Automatic exit bus-off mode is enabled, the hardware will automatically leave bus-off mode as soon as an exit timing is detected on the CAN bus. When Automatic exit bus-off mode is disabled, the software must enter/leave the freeze mode once more, and then the bus-off state is left only when an exit timing is detected on the CAN bus.
Bit 5	AEDEN	0x0	rw	Automatic exit doze mode enable 0: Automatic exit sleep mode disabled 1: Automatic exit sleep mode enabled Note: When Automatic exit sleep mode is disabled, the sleep mode is left by software clearing the sleep request command. When Automatic exit sleep mode is enabled, the sleep mode is left without the need of software intervention as soon as a message is monitored on the CAN bus.
Bit 4	PRSFEN	0x0	rw	Prohibit retransmission enable when sending fails enable 0: Retransmission is enabled. 1: Retransmission is disabled.
Bit 3	MDRSEL	0x0	rw	Message discard rule select when overflow 0: The previous message is discarded. 1: The new incoming message is discarded.
Bit 2	MMSSR	0x0	rw	Multiple message transmit sequence rule 0: The message with the smallest identifier is first transmitted. 1: The message with the first request order is first transmitted.
Bit 1	DZEN	0x1	rw	Doze mode enable 0: Sleep mode is disabled. 1: Sleep mode is enabled. Note: The hardware will automatically leave sleep mode when the AEDEN ib set and a message is monitored on the CAN bus. After CAN reset or partial software reset, this bit is forced to be set by hardware, that is, the CAN will keep in sleep mode, by default.
Bit 0	FZEN	0x0	rw	Freeze mode enable 0: Freeze mode disabled 1: Freeze mode enabled Note: The CAN leaves Freeze mode once 11 consecutive recessive bits have been detected on the RX pin. For this reason, the software acknowledges the entry of Freeze mode after the FZC bit is cleared by hardware. The Freeze mode is entered only when the current CAN activity (transmission or reception) is completed. Thus the sotware acknowledges the exit of Freeze mode after the FZC bit is cleared by hardware.

20.7.1.2 CAN master status register (CAN_MSTS)

Bit	Register	Reset value	Type	Description
Bit 31: 12	Reserved	0x00000	resd	Kept at its default value.
Bit 11	REALRX	0x1	ro	Real time level on RX pin 0: Low 1: High
Bit 10	LSAMPRX	0x1	ro	Last sample level on RX pin） 0: Low 1: High。 Note: This value keeps updating with the REALRX.
Bit 9	CURS	0x0	ro	Current receive status 0: No reception occurs 1: Reception is in progress Note: This bit is set by hardware when the CAN reception starts, and it is cleared by hardware at the end of reception.
Bit 8	CUSS	0x0	ro	Current transmit status 0: No transmit occurs 1: ransmit is in progress Note: This bit is set by hardware when the CAN transmission starts, and it is cleared by hardware at the end of transmission.
Bit 7: 5	Reserved	0x0	resd	Kept at its default value.
Bit 4	EDZIF	0x0	rw1c	Enter doze mode interrupt flag 0: Sleep mode is not entered or no condition for flag set. 1: Sleep mode is entered. Note: This bit is set by hardware only when EDZIEN=1 and the CAN enters Sleep mode. Whe set, this bit will generate a status change interrupt. This bit is cleared by software (writing 1 to itself) or by hardware when DZC is cleared.
Bit 3	QDZIF	0x0	rw1c	Exit doze mode interrupt flag 0: Sleep mode is not left or no condition for exit. 1: Sleep mode has been left or exit condition has generated. Note: This bit is cleared by software (writing 1 to itself) Sleep mode is left when a SOF is detected on the bus. When QDZIEN=1, this bit will generate a status change interrupt.
Bit 2	EOIF	0x0	rw1c	Error occur interrupt flag 0: No error interrupt or no condition for error interrupt flag 1: Error interrupt is generated. Note: This bit is cleared by software (writing 1 to itself). This bit is set by hardware only when the corresponding bit is set in the CAN_ESTS register and the corresponding interrupt enable bit in the CAN_INTEN register is enabled. When EOIEN=1, setting this bit will generate a status change interrupt.
Bit 1	DZC	0x1	ro	Doze mode acknowledge 0: The CAN is not in Sleep mode. 1: CAN is in Sleep mode. Note: This bit is used to decide whether the CAN is in Sleep mode or not. This bit acknowledges the Sleep mode

				request generated by software. The Sleep mode can be entered only when the current CAN activity (transmission or reception) is completed. For this reason, the software acknowledges the entry of Sleep mode after this bit is set by hardware. The Sleep mode is left only once 11 consecutive recessive bits have been detect on the CAN RX pin. For this reason, the software acknowledges the exit of Sleep mode after this bit is cleared by hardware.
Bit 0	FZC	0x0	ro	Freeze mode confirm 0: The CAN is not in Freeze mode. 1: The CAN is in Freeze mode. Note: This bit is used to decide whether the CAN is in Freeze mode or not. This bit acknowledges the Freeze mode request generated by software. The Freeze mode can be entered only when the current CAN activity (transmission or reception) is completed. For this reason, the software acknowledges the entry of Freeze mode after this bit is set by hardware. The Freeze mode is left only once 11 consecutive recessive bits have been detect on the CAN RX pin. For this reason, the software acknowledges the exit of Freeze mode after this bit is cleared by hardware.

20.7.1.3 CAN transmit status register (CAN_TSTS)

Bit	Register	Reset value	Type	Description
Bit 31	TM2LPF	0x0	ro	Transmit mailbox 2 lowest priority flag 0: Mailbox 2 is not given the lowest priority. 1: Lowest priority (This indicates that more than one mailboxes are pending for transmission, the mailbox 2 has the lowest priority.)
Bit 30	TM1LPF	0x0	ro	Transmit mailbox 1 lowest priority flag 0: Mailbox 1 is not given the lowest priority. 1: Lowest priority (This indicates that more than one mailboxes are pending for transmission, the mailbox 1 has the lowest priority.)
Bit 29	TM0LPF	0x0	ro	Transmit mailbox 0 lowest priority flag 0: Mailbox 0 is not given the lowest priority. 1: Lowest priority (This indicates that more than one mailboxes are pending for transmission, the mailbox 0 has the lowest priority.)
Bit 28	TM2EF	0x1	ro	Transmit mailbox 2 empty flag This bit is set by hardware when no transmission is pending in the mailbox 2.
Bit 27	TM1EF	0x1	ro	Transmit mailbox 1 empty flag This bit is set by hardware when no transmission is pending in the mailbox 1.
Bit 26	TM0EF	0x1	ro	Transmit mailbox 0 empty flag This bit is set by hardware when no transmission is pending in the mailbox 0.
Bit 25: 24	TMNR	0x0	ro	Transmit Mailbox number record Note: If the transmit mailbox is free, these two bits refer to the number of the next transmit mailbox free. For example, in case of free CAN, the value of these two bit becomes 01 after a message transmit request is written. If the transmit box is full, these two bits refer to the number

				of the transmit mailbox with the lowest priority. For example, when there are three messages are pending for transmission, the identifiers of mailbox 0, mailbox 1 and mailbox 2 are 0x400, 0x433 and 0x411 respectively, and the value of these two bits becomes 01.
Bit 23	TM2CT	0x0	ro	Transmit mailbox 2 cancel transmit 0: No effect 1: Transmission is cancelled. Note: Software sets this bit to abort the transmission of mailbox 2. This bit is cleared by hardware when the transmit message in the mailbox 2 is cleared. Setting this bit has no effect if the mailbox 2 is free.
Bit 22: 20	Reserved	0x0	resd	Kept at its default value.
Bit 19	TM2TEF	0x0	rw1c	Transmit mailbox 2 transmission error flag 0: No error 1: Mailbox 2 transmission error Note: This bit is set when the mailbox 2 transmission error occurred. It is cleared by software writing 1 or by hardware at the start of the next transmission
Bit 18	TM2ALF	0x0	rw1c	Transmit mailbox 2 arbitration lost flag 0: No arbitration lost 1: Transmit mailbox 2 arbitration lost Note: This bit is set when the mailbox 2 transmission failed due to an arbitration lost. It is cleared by software writing 1 or by hardware at the start of the next transmission
Bit 17	TM2TSF	0x0	rw1c	Transmit mailbox 2 transmission success flag 0: Transmission failed 1: Transmission was successful. Note: This bit indicates whether the mailbox 2 transmission is successful or not. It is cleared by software writing 1.
Bit 16	TM2TCF	0x0	rw1c	Transmit mailbox 2 transmission completed flag 0: Transmission is in progress 1: Transmission is completed Note: This bit is set by hardware when the transmission/abort request on mailbox 2 has been completed. It is cleared by software writing 1 or by hardware when a new transmission request is received. Clearing this bit will clear the TSMF2, ALMF2 and TEMF2 bits of mailbox 2.
Bit 15	TM1CT	0x0	rw1s	Transmit mailbox 1 cancel transmit 0: No effect 1: Mailbox 1 cancel transmit Note: This bit is set by software to abort the transmission request on mailbox 1. Clearing the message transmission on mailbox 1 will clear this bit. Setting by this software has no effect when the mailbox 1 is free.
Bit 14: 12	Reserved	0x0	resd	Kept at its default value.
Bit 11	TM1TEF	0x0	rw1c	Transmit mailbox 1 transmission error flag 0: No error 1: Mailbox 1 transmission error

				Note: This bit is set when the mailbox 1 transmission error occurred. It is cleared by software writing 1 or by hardware at the start of the next transmission
Bit 10	TM1ALF	0x0	rw1c	Transmit mailbox 1 arbitration lost flag 0: No arbitration lost 1: Transmit mailbox 1 arbitration lost Note: This bit is set when the mailbox 1 transmission failed due to an arbitration lost. It is cleared by software writing 1 or by hardware at the start of the next transmission
Bit 9	TM1TSF	0x0	rw1c	Transmit mailbox 1 transmission success flag 0: Transmission failed 1: Transmission was successful. Note: This bit indicates whether the mailbox 1 transmission is successful or not. It is cleared by software writing 1.
Bit 8	TM1TCF	0x0	rw1c	Transmit mailbox 1 transmission completed flag 0: Transmission is in progress 1: Transmission is completed Note: This bit is set by hardware when the transmission/abort request on mailbox 1 has been completed. It is cleared by software writing 1 or by hardware when a new transmission request is received. Clearing this bit will clear the TSMF1, ALMF1 and TEMF1 bits of mailbox 1.
Bit 7	TM0CT	0x0	rw1s	Transmit mailbox 0 cancel transmit 0: No effect 1: Mailbox 0 cancel transmit Note: This bit is set by software to abort the transmission request on mailbox 0. Clearing the message transmission on mailbox 0 will clear this bit. Setting by this software has no effect when the mailbox 0 is free.
Bit 6: 4	Reserved	0x0	resd	Kept at its default value.
Bit 3	TM0TEF	0x0	rw1c	Transmit mailbox 0 transmission error flag 0: No error 1: Mailbox 0 transmission error Note: This bit is set when the mailbox 0 transmission error occurred. It is cleared by software writing 0 or by hardware at the start of the next transmission
Bit 2	TM0ALF	0x0	rw1c	Transmit mailbox 0 arbitration lost flag 0: No arbitration lost 1: Transmit mailbox 0 arbitration lost Note: This bit is set when the mailbox 0 transmission failed due to an arbitration lost. It is cleared by software writing 1 or by hardware at the start of the next transmission
Bit 1	TM0TSF	0x0	rw1c	Transmit mailbox 0 transmission success flag 0: Transmission failed 1: Transmission was successful.

				Note: This bit indicates whether the mailbox 0 transmission is successful or not. It is cleared by software writing 1.
Bit 0	TM0TCF	0x0	rw1c	Transmit mailbox 0 transmission completed flag 0: Transmission is in progress 1: Transmission is completed Note: This bit is set by hardware when the transmission/abort request on mailbox 0 has been completed. It is cleared by software writing 1 or by hardware when a new transmission request is received. Clearing this bit will clear the TM0TSF, TM0ALF and TM0TEF bits of mailbox 0.

20.7.1.4 CAN receive FIFO 0 register (CAN_RF0)

Bit	Register	Reset value	Type	Description
Bit 31: 6	Reserved	0x0000000	resd	Kept at its default value.
Bit 5	RF0R	0x0	rw1s	Receive FIFO 0 release 0: No effect 1: Release FIFO Note: This bit is set by software to release FIFO 0. It is cleared by hardware when the FIFO 0 is released. Seting this bit by software has no effect when the FIFO 0 is empty. If there are more than two messages pending in the FIFO 0, the software has to release the FIFO 0 to access the second message.
Bit 4	RF0OF	0x0	rw1c	Receive FIFO 0 overflow flag 0: No overflow 1: Receive FIFO 0 overflow Note: This bit is set by hardware when a new message has been received and passed the filter while the FIFO 0 is full. It is cleared by software by writing 1.
Bit 3	RF0FF	0x0	rw1c	Receive FIFO 0 full flag 0: Receive FIFO 0 is not full 1: Receive FIFO 0 is full Note: This bit is set by hardware when three messages are pending in the FIFO 0. It is cleared by software by writing 1.
Bit 2	Reserved	0x0	resd	Kept at its default value.
Bit 1: 0	RF0MN	0x0	ro	Receive FIFO 0 message num Note: These two bits indicate how many messages are pending in the FIFO 0. RF0ML bit is incremented by one each time a new message has been received and passed the fitler while the FIFO 0 is not full. RF0ML bit is decremented by one each time the software releases the receive FIFO 0 by writing 1 to the RF0R bit.

20.7.1.5 CAN receive FIFO 1 register (CAN_RF1)

Bit	Register	Reset value	Type	Description
Bit 31: 6	Reserved	0x0000000	resd	Kept at its default value.
Bit 5	RF1R	0x0	rw1s	Receive FIFO 1 release 0: No effect 1: Release FIFO Note: This bit is set by software to release FIFO 1. It is cleared by hardware when the FIFO 1 is released. Seting this bit by software has no effect when the FIFO 1 is empty. If there are more than two messages pending in the FIFO 0, the software has to release the FIFO 1 to access the second message.
Bit 4	RF1OF	0x0	rw1c	Receive FIFO 1 overflow flag 0: No overflow

				1: Receive FIFO 1 overflow Note: This bit is set by hardware when a new message has been received and passed the filter while the FIFO 1 is full. It is cleared by software by writing 1.
Bit 3	RF1FF	0x0	rw1c	Receive FIFO 1 full flag 0: Receive FIFO 1 is not full 1: Receive FIFO 1 is full Note: This bit is set by hardware when three messages are pending in the FIFO 1. It is cleared by software by writing 1.
Bit 2	Reserved	0x0	resd	Kept at its default value.
Bit 1: 0	RF1MN	0x0	ro	Receive FIFO 1 message num Note: These two bits indicate how many messages are pending in the FIFO 1. RF1ML bit is incremented by one each time a new message has been received and passed the fitler while the FIFO 1 is not full. RF1ML bit is decremented by one each time the software releases the receive FIFO 1 by writing 1 to the RF1R bit.

20.7.1.6 CAN interrupt enable register (CAN_INTEN)

Bit	Register	Reset value	Type	Description
Bit 31: 18	Reserved	0x0000	resd	Kept at its default value.
Bit 17	EDZIEN	0x0	rw	Enter doze mode interrupt enable 0: Enter sleep mode interrupt disabled 1: Enter sleep mode interrupt enabled Note: EDZIF flag bit corresponds to this interrupt. An interrupt is generated when both this bit and EDZIF bit are set.
Bit 16	QDZIEN	0x0	rw	Quit doze mode interrupt enable 0: Quit sleep mode interrupt disabled 1: Quit sleep mode interrupt enabled Note: The flag bit of this interrupt is the QDZIF bit. An interrupt is generated when both this bit and QDZIF bit are set.
Bit 15	EOIEN	0x0	rw	Error occur interrupt enable 0: Error interrupt disabled 1: Error interrupt enabled Note:The flag bit of this interrupt is the EOIF bit. An interrupt is generated when both this bit and EOIF bit are set.
Bit 14: 12	Reserved	0x0	resd	Kept at its default value.
Bit 11	ETRIEN	0x0	rw	Error type record interrupt enable 0: Error type record interrupt disabled 1: Error type record interrupt enabled Note: EOIF is set only when this interrupt is enabled and the ETR[2: 0] is set by hardware.
Bit 10	BOIEN	0x0	rw	Bus-off interrupt enable 0: Bus-off interrupt disabled 1: Bus-off interrupt enabled Note: EOIF is set only when this interrupt is enabled and the BOF is set by hardware.
Bit 9	EPIEN	0x0	rw	Error passive interrupt enable

				0: Error passive interrupt disabled 1: Error passive interrupt enabled Note: EOIF is set only when this interrupt is enabled and the EPF is set by hardware.
Bit 8	EAIEN	0x0	rw	Error active interrupt enable 0: Error warning interrupt disabled 1: Error warning interrupt enabled Note: EOIF is set only when this interrupt is enabled and the EAF is set by hardware.
Bit 7	Reserved	0x0	resd	Kept at its default value.
Bit 6	RF1OIEN	0x0	rw	Receive FIFO 1 overflow interrupt enable 0: Receive FIFO 1 overflow interrupt disabled 1: Receive FIFO 1 overflow interrupt enabled Note: The flag bit of this interrupt is the RF1OF bit. An interrupt is generated when this bit and RF1OF bit are set.
Bit 5	RF1FIEN	0x0	rw	Receive FIFO 1 full interrupt enable 0: Receive FIFO 1 full interrupt disabled 1: Receive FIFO 1 full interrupt enabled Note: The flag bit of this interrupt is the RF1FF bit. An interrupt is generated when this bit and RF1FF bit are set.
Bit 4	RF1MIEN	0x0	rw	FIFO 1 receive message interrupt enable 0: FIFO 1 receive message interrupt disabled 1: FIFO 1 receive message interrupt enabled Note: The flag bit of this interrupt is RF1MN bit, so an interrupt is generated when this bit and RF1MN bit are set.
Bit 3	RF0OIEN	0x0	rw	Receive FIFO 0 overflow interrupt enable 0: Receive FIFO 0 overflow interrupt disabled 1: Receive FIFO 0 overflow interrupt enabled Note: The flag bit of this interrupt is RF0OF bit, so an interrupt is generated when this bit and RF0OF bit are set.
Bit 2	RF0FIEN	0x0	rw	Receive FIFO 0 full interrupt enable 0: Receive FIFO 0 full interrupt disabled 1: Receive FIFO 0 full interrupt enabled Note: The flag bit of this interrupt is the RF0FF bit. An interrupt is generated when this bit and RF0FF bit are set
Bit 1	RF0MIEN	0x0	rw	FIFO 0 receive message interrupt enable 0: FIFO 0 receive message interrupt disabled 1: FIFO 0 receive message interrupt enabled Note: The flag bit of this interrupt is the RF0MN bit. An interrupt is generated when this bit and RF0MN bit are set
Bit 0	TCIEN	0x0	rw	Transmit mailbox empty interrupt enable 0: Transmit mailbox empty interrupt disabled 1: Transmit mailbox empty interrupt enabled Note: The flag bit of this interrupt is the TMxTCF bit. An interrupt is generated when this bit and TMxTCF bit are set

20.7.1.7 CAN error status register (CAN_ESTS)

Bit	Register	Reset value	Type	Description
Bit 31: 24	REC	0x00	ro	Receive error counter This counter is implemented in accordance with the receive part of the falut confinement mechanism of the CAN protocol.
Bit 23: 16	TEC	0x00	ro	Transmit error counter This counter is implemented in accordance with the transmit part of the falut confinement mechanism of the CAN protocol.
Bit 15: 7	Reserved	0x00	resd	Kept at its default value.
Bit 6: 4	ETR	0x0	rw	Error type record 000: No error 001: Bit stuffing error 010: Format error 011: Acknowledgement error 100: Recessive bit error 101: Dominant bit error 110: CRC error 111: Set by software Note: This field is used to indicate the current error type. It is set by hardware according to the error condition detected on the CAN bus. It is cleared by hardware when a message has been transmitted or received successfully. If the error code 7 is not used by hardware, this field can be set by software to monitor the code update.
Bit 3	Reserved	0x0	resd	Kept at its default value.
Bit 2	BOF	0x0	ro	Bus-off flag 0: Bus-off state is not entered. 1: Bus-off state is entered. Note: When the TEC is greater than 255, the bus-off state is entered, and this bit is set by hardware.
Bit 1	EPF	0x0	ro	Error passive flag 0: Error passive state is not entered 1: Error passive state is entered Note: This bit is set by hardware when the current error times has reached the Error passive state limit (Receive Error Counter or Transmit Error Counter >127)
Bit 0	EAF	0x0	ro	Error active flag 0: Error active state is not entered 1: Error active state is entered Note: This bit is set by hardware when the current error times has reached the Error active state limit (Receive Error Counter or Transmit Error Counter ≥96)

20.7.1.8 CAN bit timing register (CAN_BTMG)

Bit	Register	Reset value	Type	Description
Bit 31	LOEN	0x0	rw	Listen-Only mode 0: Listen-Only mode disabled 1: Listen-Only mode enabled
Bit 30	LBEN	0x0	rw	Loop back mode 0: Loop back mode disabled 1: Loop back mode enabled
Bit 29: 26	Reserved	0x0	resd	Kept at its default value.
Bit 25: 24	RSAW	0x1	rw	Resynchronization width tRSAW = tCAN x (RSAW[1: 0] + 1） Note: This field defines the maximum of time unit that the CAN handware is allowed to lengthen or shorten in a bit.
Bit 23	Reserved	0x0	resd	Kept at its default value.
Bit 22: 20	BTS2	0x2	rw	Bit time segment 2 tBTS2 = tCAN x (BTS2[2: 0] + 1) Note: This field defines the number of time unit in Bit time segment 2.
Bit 19: 16	BTS1	0x3	rw	Bit time segment 1 tBTS1 = tCAN x (BTS1[3: 0] + 1) Note: This field defines the number of time unit in Bit time segment 1.
Bit 15: 12	Reserved	0x0	resd	Kept at its default value.
Bit 11: 0	BRDIV	0x000	rw	Baud rate division tq = (BRDIV[11: 0]+1) x tPCLK Note: This field defines the length of a time unit (tq).

20.7.2 CAN mailbox registers

This section describes the registers of the transmit and receive mailboxes. Refer to *20.6.5* for more information on register map.

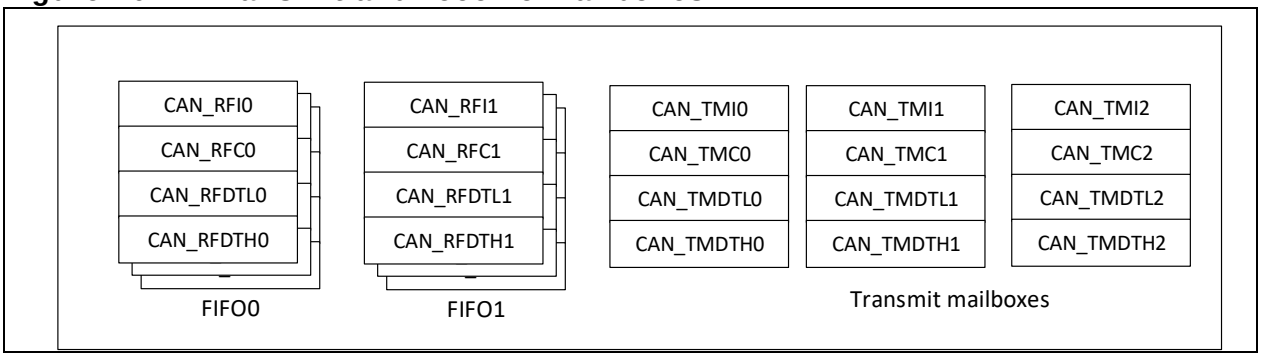
Transmit and receive mailboxes are the same except:

- RFFMN field in the CAN_RFCx register
- A receive mailbox is read only
- A transmit mailbox can be written only when empty. TMxEF=1 in the CAN_TSTS register indicates that the mailbox is empty.

There are three transmit mailboxes and two receive mailboxes. Each receive mailbox has 3-level depth of FIFO, and can only access to the first received message in the FIFO.

Each mailbox contains four registers.

Figure 20-14 Transmit and receive mailboxes



20.7.2.1 Transmit mailbox identifier register (CAN_TMIx) (x=0..2)

Note: 1. This register is write protected when its mailboxes are pending for transmission.
2.This register implements the Transmit Request control (bit 0) — reset value 0.

Bit	Register	Reset value	Type	Description
Bit 31: 21	TMSID/ TMEID	0xXXX	rw	Transmit mailbox standard identifier or extended identifier high bytes Note: This field defines the 11-bit high bytes of the standard identifier or extended identifier.
Bit 20: 3	TMEID	0xXXXXX	rw	Transmit mailbox extended identifier Note: This field defines the 18-bit low bytes of the extended identifier.
Bit 2	TMIDSEL	0xX	rw	Transmit mailbox identifier type select 0: Standard identifier 1: Extended identifier
Bit 1	TMFRSEL	0xX	rw	Transmit mailbox frame type select 0: Data frame 1: Remote frame
Bit 0	TMSR	0x0	rw	Transmit mailbox send request 0: No effect 1: Transmit request Note: This bit is cleared by hardware when the transmission has been completed (The mailbox becomes empty)

20.7.2.2 Transmit mailbox data length and time stamp register (CAN_TMCx) (x=0..2)

All the bits in the register are write protected when the mailbox is not in empty state.

Bit	Register	Reset value	Type	Description
Bit 31: 16	TMTS	0xXXXX	rw	Transmit mailbox time stamp Note: This field contains the value of the CAN timer sampled at the SOF transmission.
Bit 15: 9	Reserved	0xXX	resd	Kept at its default value
Bit 8	TMTSTEN	0xX	rw	Transmit mailbox time stamp transmit enable 0: Time stamp is not sent 1: Time stamp is sent Note: This bit is valid only when the time-triggered communication mode is enabled. In the time stamp MTS[15: 0], the MTS[7: 0] is stored in the TMDT7, and MTS[15: 8] in the TMDT6. The data length must be programmed as 8 to send time stamp.
Bit 7: 4	Reserved	0xX	resd	Kept at its default value
Bit 3: 0	TMDTBL	0xX	rw	Transmit mailbox data byte length Note: This field defines the data length of a transmit message. A transmit message can contain from 0 to 8 data bytes.

20.7.2.3 Transmit mailbox data low register (CAN_TMDTLx) (x=0..2)

All the bits in the register are write protected when the mailbox is not in empty state.

Bit	Register	Reset value	Type	Description
Bit 31: 24	TMDT3	0xXX	rw	Transmit mailbox data byte 3
Bit 23: 16	TMDT2	0xXX	rw	Transmit mailbox data byte 2
Bit 15: 8	TMDT1	0xXX	rw	Transmit mailbox data byte 1
Bit 7: 0	TMDT0	0xXX	rw	Transmit mailbox data byte 0

20.7.2.4 Transmit mailbox data high register (CAN_TMDTHx) (x=0..2)

All the bits in the register are write protected when the mailbox is not in empty state.

Bit	Register	Reset value	Type	Description
Bit 31: 24	TMDT7	0xXX	rw	Transmit mailbox data byte 7
Bit 23: 16	TMDT6	0xXX	rw	Transmit mailbox data byte 6 Note: This field will be replaced with MTS[15: 8] when the time-triggered communication mode is enabled and the corresponding time stamp transmit is enabled.
Bit 15: 8	TMDT5	0xXX	rw	Transmit mailbox data byte 5
Bit 7: 0	TMDT4	0xXX	rw	Transmit mailbox data byte 4

20.7.2.5 Receive FIFO mailbox identifier register (CAN_RFIx) (x=0..1)

Note: All the receive mailbox registers are read only.

Bit	Register	Reset value	Type	Description
Bit 31: 21	RFSID/RFEID	0xXXX	ro	Receive FIFO standard identifier or receive FIFO extended identifier Note: This field defines the 11-bit high bytes of the standard identifier or extended identifier.
Bit 20: 3	RFEID	0xXXXXX	ro	Receive FIFO extended identifier Note: This field defines the 18-bit low bytes of the extended identifier.
Bit 2	RFIDI	0xX	ro	Receive FIFO identifier type indication 0: Standard identifier 1: Extended identifier
Bit 1	RFFRI	0xX	Ro	Receive FIFO frame type indication 0: Data frame 1: Remote frame
Bit 0	Reserved	0x0	resd	Kept at its default value

20.7.2.6 Receive FIFO mailbox data length and time stamp register (CAN_RFCx) (x=0..1)

Note: All the receive mailbox registers are read only.

Bit	Register	Reset value	Type	Description
Bit 31: 16	RFTS	0xXXXX	ro	Receive FIFO time stamp Note: This field contains the value of the CAN timer sampled at the start of a receive frame.
Bit 15: 8	RFFMN	0xXX	ro	Receive FIFO filter match number Note: This field contains the filter number that a message has passed through.
Bit 7: 4	Reserved	0xX	resd	Kept at its default value
Bit 3: 0	RFDTL	0xX	ro	Receive FIFO data length Note: This field defines the data length of a receive message. A transmit message can contain from 0 to 8 data

bytes. For a remote frame, its data length RFDTl is fixed 0.

20.7.2.7 Receive FIFO mailbox data low register (CAN_RFDTLx) (x=0..1)

Note: All the receive mailbox registers are read only.

Bit	Register	Reset value	Type	Description
Bit 31: 24	RFDT3	0xXX	ro	Receive FIFO data byte 3
Bit 23: 16	RFDT2	0xXX	ro	Receive FIFO data byte 2
Bit 15: 8	RFDT1	0xXX	ro	Receive FIFO data byte 1
Bit 7: 0	RFDT0	0xXX	ro	Receive FIFO data byte 0

20.7.2.8 Receive FIFO mailbox data high register (CAN_RFDTHx) (x=0..1)

Note: All the receive mailbox registers are read only.

Bit	Register	Reset value	Type	Description
Bit 31: 24	RFDT7	0xXX	ro	Receive FIFO data byte 7
Bit 23: 16	RFDT6	0xXX	ro	Receive FIFO data byte 6
Bit 15: 8	RFDT5	0xXX	ro	Receive FIFO data byte 5
Bit 7: 0	RFDT4	0xXX	ro	Receive FIFO data byte 4

20.7.3 CAN filter registers

20.7.3.1 CAN filter control register (CAN_FCTRL)

Note: All the non-reserved bits of this register are controlled by software completely.

Bit	Register	Reset value	Type	Description
Bit 31: 1	Reserved	0x160E0700	resd	Kept at its default value
Bit 0	FCS	0x1	rw	Filter configuration switch 0: Disabled (Filter bank is active) 1: Enabled (Filter bank is in configuration mode) Note: The initialization of the filter bank can be configured only when it is in configuration mode.

20.7.3.2 CAN filter mode configuration register (CAN_FMCFG)

Note: This register can be written only when FCS=1 in the CAN_FCTRL register (The filter is in configuration mode)

Bit	Register	Reset value	Type	Description
Bit 31: 14	Reserved	0x00000	resd	Kept at its default value
Bit 13: 0	FMSELx	0x0000	rw	Filter mode select Each bit corresponds to a filter bank. 0: Identifier mask mode 1: Identifier list mode

20.7.3.3 CAN filter bit width configuration register (CAN_ FBWCFG)

Note: This register can be written only when FCS=1 in the CAN_FCTRL register (The filter is in configuration mode)

Bit	Register	Reset value	Type	Description
Bit 31: 14	Reserved	0x00000	resd	Kept at its default value
Bit 13: 0	FBWSELx	0x0000	rw	Filter bit width select Each bit corresponds to a filter bank. 0: Dual 16-bit 1: Single 32-bit

20.7.3.4 CAN filter FIFO association register (CAN_ FRF)

Note: This register can be written only when FCS=1 in the CAN_FCTRL register (The filter is in configuration mode)

Bit	Register	Reset value	Type	Description
Bit 31: 14	Reserved	0x00000	resd	Kept at its default value
Bit 13: 0	FRFSELx	0x0000	rw	Filter relation FIFO select Each bit corresponds to a filter bank. 0: Associated with FIFO0 1: Associated with FIFO1

20.7.3.5 CAN filter activation control register (CAN_ FACFG)

Bit	Register	Reset value	Type	Description
Bit 31: 14	Reserved	0x00000	resd	Kept at its default value
Bit 13: 0	FAENx	0x0000	rw	Filter active enable Each bit corresponds to a filter bank. 0: Disabled 1: Enabled

20.7.3.6 CAN filter bank i filter bit register (CAN_ FiFBx) (i=0..13; x=1..2)

Note: There are 14 filter banks (i=0..13). Each filter bank consists of two 32-bit registers, CAN_FiFB[2: 1]. This register can be modified only when the FAENx bit of the CAN_FACFG register is cleared or the FCS bit of the CAN_FCTRL register is set.

Bit	Register	Reset value	Type	Description
Bit 31: 0	FFDB	0xXXXX XXXX	rw	Filters filter data bit Identifier list mode: The configuration value of the register matches with the level of the corresponding bit of the data received on the bus (If it is a standard frame, the value of the corresponding bit of the extended frame is neglected.) Identifier mark mode: Only the bit with its register configuration value 1 can match with the level of the corresponding bit of the data received on the bus. It don't care when the register value is 0.

21 Universal serial bus full-seed device interface (USBFS)

21.1 USBFS introduction

The USBFS implements the USB2.0 full-speed protocols. The bus speed is 12 Mb/s. It supports control transfer, bulk transfer, synchronous transfer and interrupt transfer, as well as USB suspend/resume.

The USBFS has eight programmable bidirectional endpoints that can be configured as different types of transfers according to specific requirements. It contains a SRAM with dual endpoints for data exchange between the endpoint and user application. In the meantime, it has achieved a dual-buffer mechanism for bulk/synchronous endpoints in order to enhance the transfer efficiency.

21.2 USBFS clock and pin configuration

21.2.1 USB clock configuration

The USB full-speed device module interface has two clocks: USB control clock and APB1 bus clock. The USB full-speed device bus speed standard is 12 Mb/s±0.25%, so it is necessary to supply 48MHz ±0.25% for the USBFS to implement USB bus sampling.

USBFS 48M clock has two sources:

- HICK 48M

  When the HICK 48M clock is used as a USB control clock, it is recommended to enable ACC feature.

- Divided by PLL

  The PLL output frequency must ensure that the USBDIV (see the CRM_CFG register) can be divided to 48MHz.

Note: The APB1 clock frequency must be greater than 12MHz when the USBFS is enabled.

21.2.2 USB pin configuration

When the USB module is enabled in the CRM, PA11 and PA12 can be multiplexed as DP/DM;

When the USB module is enabled in the CRM and PA8 is configured as the push-pull output, the PA8 can be used as an alternate function of SOF output.

Pin	GPIO	Condition
USB_DM	PA11	USB module enabled in the CRM
USB_DP	PA12	USB module enabled in the CRM
USB_SOF	PA8	Optional. If the USB module is enabled in the CRM, the SOF output feature is enabled, and the PA8 is configured as a push-pull output.

21.3 USBFS functional description

21.3.1 USB initialization

After the USB module is enabled (enalbe USBFS clock in the CRM), it is necessary to initialize the USBFS prior to the host enumeration as follows:

1. Clear software set by setting CSRST = 0
2. Clear all status flags by setting INTSTS=0
3. Enable USB Core by setting DEVADDR.CEN=1
4. Configure interrupt enable bits
5. Enable USB PHY by setting CTRL.DISUSB=0

21.3.2 Endpoint configuration

The USBFS supports up to 8 bidirectional and 16 unidirectional endpoints (8 IN and 8 OUT). Each point has its corresponding USBFS endpoint N register (USBFS_EPTn) that is used to store the endpoint status. The endpoint configuration includes:

- Endpoint number (by configuring the EPTADDR, the endpoint number of each endpoint register is programmable)
- Transfer type (control transfer, bulk transfer, isochronous transfer and interrupt transfer)
- Buffer for IN/OUT endpoint (buffer allocation is described in the next section)
- IN/OUT Toggle status (correspond to DATA0/DATA1)
- IN/OUT status (VALID, NAK, STALL, DISABLE)

Note: Endpoint 0 acts as a control point by default. It is usually configuread after receiving a reset signal from the host.

21.3.3 USB buffer

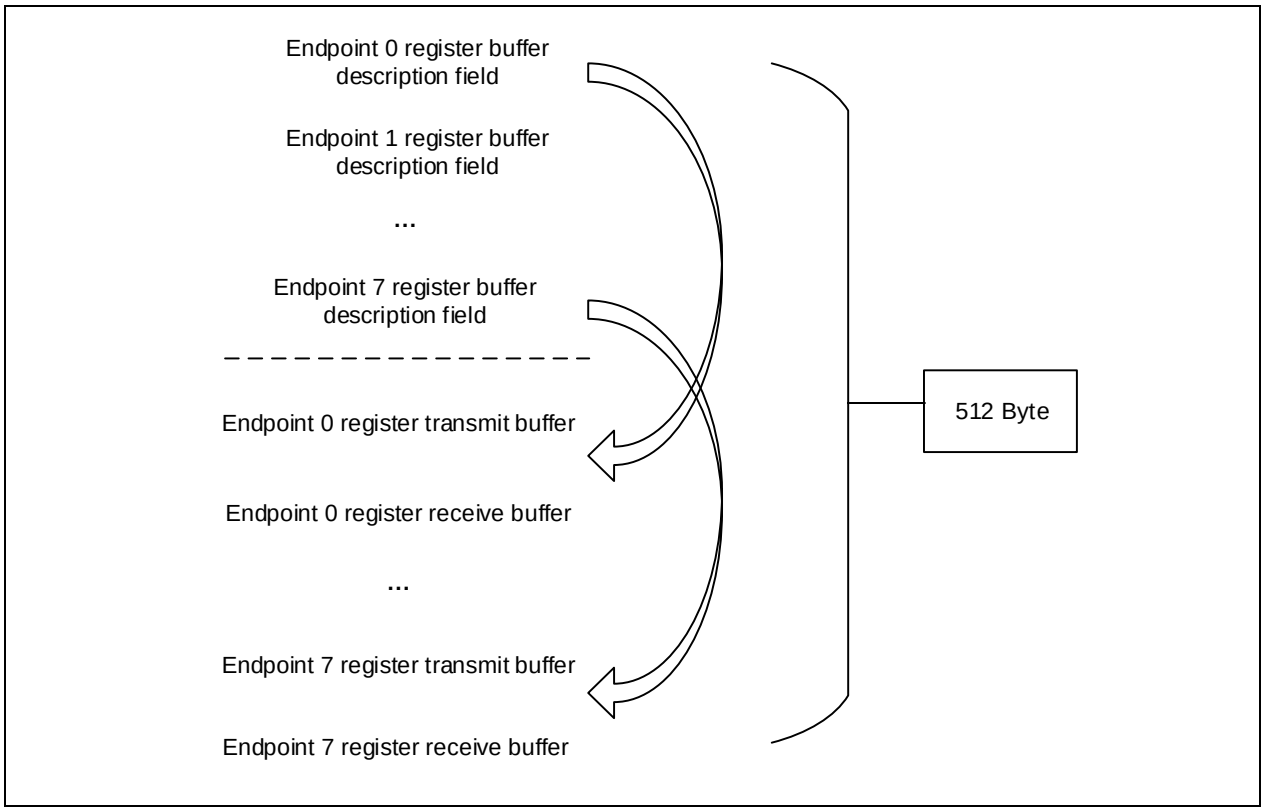
USB has a dual-port SRAM buffer for data exchange between endpoint and user application. Both the user application and the USBFS module can access to the buffer at the same time. The buffer size can be automatically adjusted according to the CAN status. *Table 21-1* lists its mapping address and size.

Table 21-1 Buffer size configuration table

Working conditions	USBBUFS	0	1			
	CAN1 status	Enable/Disable	Disable	Disable	Enable	Enable
	CAN2 status	Enable/Disable	Disable	Enable	Disable	Enable
Buffer size		512 Byte	1280 Byte	1024 Byte	1024 Byte	768 Byte
Address range		0x4000 6000~ 0x4000 63FF	0x4000 7800~ 0x4000 81FF	0x4000 7800~ 0x4000 7FFF	0x4000 7800~ 0x4000 7FFF	0x4000 7800~ 0x4000 7DFF

The buffer area is composed of the endpoint register buffer description field and the endpoint buffer. The endpoint register description table lists the offset address of endpoint receive/transmit. The figure below gives an example of a buffer structure (512 bytes)

Start address: 0x40006000



In the USBFS module, each endpoint register corresponds to a buffer description field, which is used to describe the buffer area and data length of the endpoint receive/transmit. A general structure of an endpoint register buffer description field is shown as follows (dual buffer description table is detailed in the next section):

Endpoint n:

0	2	4	6	8	10	12	14
TnADDR	Reserved	TnLEN	Reserved	RnADDR	Reserved	RnLEN	Reserved
Transmit buffer description				Buffer receive description			

The start address of a buffer description field=buffer address + BTADDR*2. The user application can put the endpoint register buffer description in different locations according to the specific needs. The BTADDR is 0 by default.

The USBFS module contains 8 endpoint registers. Each endpoint register description table acutally occupies 8 bytes. When programming, the user should reserve enough space for buffer description field according to the endpoint register used. While allocating transmit/receive buffer to the endpoint, the offset address is not allowed to occupy the buffer description and transmit/receive buffer area of other endpoints.

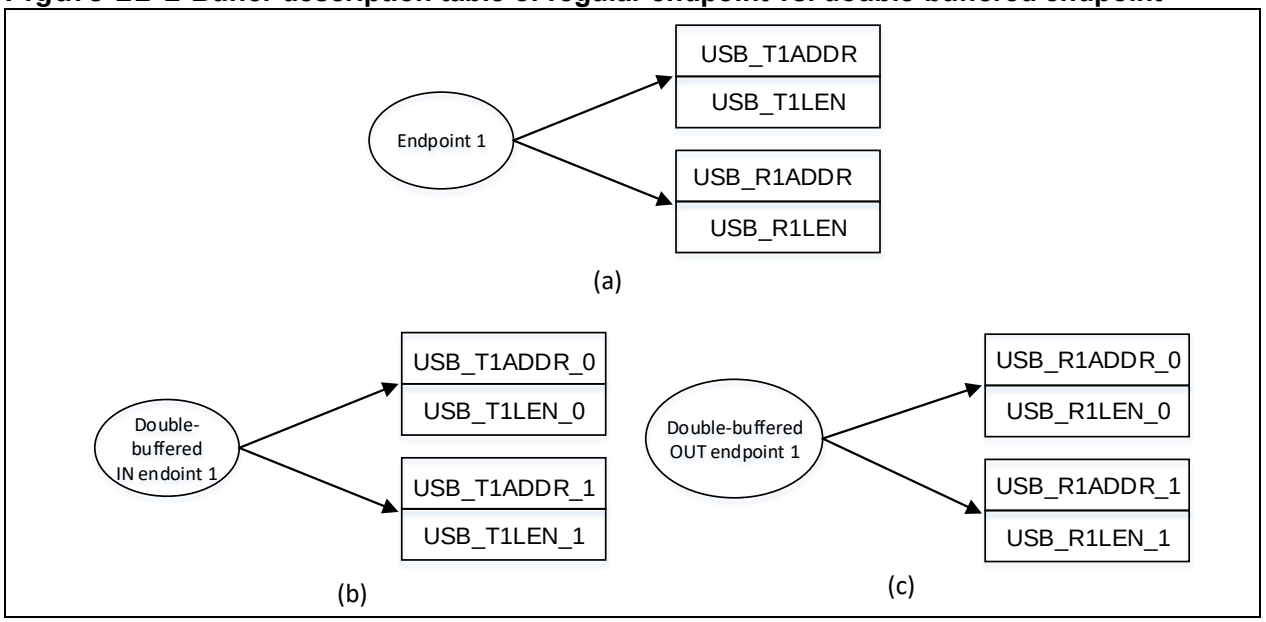
Note: The APB1 bus width is 32 bits, while the buffer is 16-bit wide memory, meaning that the APB1 bus can write only two-byte data to a packet buffer each time. For this reason, 8 consecutive write accesses are required when a 16-byte data is to be written.

21.3.4 Double-buffered endpoints

Double-buffered mode is designed in the USBFS module in order to increase the transaction rate of bulk transfer and isochronous transfer.

One IN endpoint (or OUT endpoint) corresponds to two buffers. *Figure 21-1* shows the differences of buffer description table between regular endpoint and double-buffered endpoint.

Figure 21-1 Buffer description table of regular endpoint vs. double-buffered endpoint



There are two endpoint transfer modes supporting double-buffered function:

- **Bulk transfer endpoints**

  Enable double-buffered feature by setting TRANS_TPYE=00 and EXF=1

- **Isochronous transfer endpoints**

  When TRANS_TPYE=10, double-buffered feature is enabled.

  Two buffers are used to increase the transfer rate. The USBFS and the user application can access to the different buffer at the same time and process data simultaneously. The USBFS and the user application must determine which one of the existing buffers is accessible, which can be indicated by the SBUF flag in the USBFS.

- **Double-buffered OUT endpoint:** SBUF corresponds to bit 6 in the USB_EPTn

When SBUF=1, USBFS uses RnADDR_0 and RnLEN_0, while the user application uses RnADDR_1 and RnLEN_1;

When SBUF=0, USBFS uses RnADDR_1 and RnLEN_1, while the user application uses RnADDR_0 and RnLEN_0

- **Double-buffered IN endpoint:** SBUF corresponds to bit 14 in the USB_EPTn

  When SBUF=1, USBFS uses TnADDR_0 and TnLEN_0, while the user application uses TnADDR_1 and TnLEN_1

  When SBUF=0, USBFS uses TnADDR_1 and TnLEN_1, while the user application uses TnADDR_0 and TnLEN_0

Note: Endpoint 0 cannot be used as a double-buffered endpoint.

21.3.5 SOF output

A SOF flag is generated when the USBFS receives a SOF sent by the host. Meanwhile, the current frame number can be read from the USBFS_SOFRNUM register. By setting the SOFOUTEN bit in the USBFS_CFG register, a SOF pulse sigal with a width of 24 APB1 clock cycles will be output onto the pin.

21.3.6 Suspend/Resume

The USB2.0 full-speed standard defines a low-power state, called Suspend. A Suspend state is entered when the idle state is detected on the bus for more than 3ms. The USBFS can enter suspend state in two ways:

1. Detect the lack of three consecutive SOF packets
2. Control register SSP is set by the application

When the device detects the lack of three consecutive SOF packets, the SSP and LPM registers must be set by the application in order to disable SOF detection and the statistic power consumtion of the USB physical transceiver.

Resume refers to a process when the USB device returns from a suspend state to a normal state. When the USB device is in suspend mode, any non-idle state (such as packet start signal SOF) of its upstream port can resume it. In addition, the USB device can also apply to activate resume operation by setting the GRESUME register, which is called a remote wakeup.

21.4 USB interrupts

Low-priority interrupts: interrupt vector number 20 and 74. When a high-priority interrupt is disabled, all the USBFS interrupts can be handled by low-priority interrupts.

High-priority interrupts: interrupt vector number 19 and 73. Only isochronous transfer and double-buffered bulk endpoints can trigger high-priority interrupts.

USB wakeup interrupts: interrupt vector number 42. While the USB enters a suspend state, the chip can be waken up by this interrupt after moving to Deep Sleep mode.

By default, the USBFS shares the interrupt vector number (19 and 20) with the CAN1, causing that the USBFS and CAN1 cannot be used at the same time. For this reason, new interrupt vector numbers (73 and 74) are created. The user application can map the USBFS interrupt vector numbers to 73 and 74 by setting the USBINTMAP bit in the CRM_INTMAP register.

21.5 USBFS registers

These peripheral registers must be accessed by words (32 bits).

Table 21-2 USBFS register map and reset values

Register	Offset	Reset value
USBFS_EPT0	0x00	0x0000
USBFS_EPT1	0x04	0x0000
USBFS_EPT2	0x008	0x0000
USBFS_EPT3	0x0C	0x0000

Register	Offset	Reset value
USBFS_EPT4	0x10	0x0000
USBFS_EPT5	0x14	0x0000
USBFS_EPT6	0x18	0x0000
USBFS_EPT7	0x1C	0x0000
USBFS_CTRL	0x40	0x0003
USBFS_INTSTS	0x44	0x0000
USBFS_SOFRNUM	0x48	0x0XXX
USBFS_DEVADDR	0x4C	0x0000
USBFS_BUFTBL	0x50	0x0000
USBFS_CFG	0x60	0x0000
USBFS_TnADDR	[USB_BUFTBL] x 2 + n x 16	0xXXXX
USBFS_TnLEN	[USB_BUFTBL] x 2 + n x 16 + 4	0xXXXX
USBFS_RnADDR	[USB_BUFTBL] x 2 + n x 16 + 8	0xXXXX
USBFS_RnLEN	[USB_BTABLE] x 2 + n x 16 + 12	0xXXXX

21.5.1 USBFS endpoint n register (USBFS_EPTn), n=[0..7]

Bit	Register	Reset value	Type	Description
Bit 15	RXTC	0x0	rw0c	Rx transaction completed This bit is set when an OUT/SETUP transaction is completed, indicating that Rx transaction is complete. 0: Software clears this bit 1: OUT/SETUP transaction is completed.
Bit 14	RXDTS	0x0	tog	Rx Data Toggle (DAT0/DATA1) Synchronization This is not ISO transfer. This bit indicates that the current transaction is DATA0/DATA1. 0: DATA0 1: DATA1
Bit 13: 12	RXSTS	0x0	tog	Rx Status This field indicates the endpoint status in response to the OUT transaction of the host. There are four states: DISABLE, NAK, STALL and ACK. 00: DISABLED, endpoint ignores all reception requests. 01: STALL, endpoint responds to all reception requests with STALL packets 10: NAK, endpoint responds to all reception requests with NAK packets 11: VALID, endpoint can be used for reception
Bit 11	SETUPTC	0x0	rog	Setup transaction completed When the RXTC is set, this bit is used to determine whether OUT/SETUP transaction is completed. 0: OUT transaction is completed 1: SETUP transaction is completed
Bit 10: 9	TRANS_TYPE	0x0	rw	Transfer type This field defines four types of USB transfers: Control, Bulk, Interrupt and ISO. 00: BULK endpoint, can work with EXF bit register 01: CTRL endpoint, can work iwth EXF bit register 10: ISO endpoint 11: INT endpoint

Bit 8	EXF	0x0	rw	Endpoint Extend function USB endpoint extend function is used for Bulk and Control transfers. For Bulk transfer, this bit is set to indicate that double-buffered is enabled. For Control transfer, if this bit is set, it detects whether the data length in the SETUP transaction is 0 or not, a STALL is returned if the value is not 0.
Bit 7	TXTC	0x0	rw0c	Tx transaction completed This bit is set when IN transaction is completed, indicating that Tx transaction is completed. 0: Software clears Tx transaction complete flag 1: IN transaction reception is completed
Bit 6	TXDTS	0x0	tog	Tx Data Toggle (DAT0/DATA1) Synchronization This is non-ISO endpoint, indicating that the current IN transaction is DATA0/DATA1. 0: DATA0 1: DATA1
Bit 5: 4	TXSTS	0x0	tog	Tx Status This field indicates the endpoint status in response to the IN transaction of the host. There are four states: DISABLE, NAK, STALL, ACK. 00: DISABLED, endpoint ignores all transmission requests. 01: STALL, endpoint responds to all transmission requests with STALL packets 10: NAK, endpoint responds to all transmission requests with NAK packets 11: VALID, endpoint can be used for transmission
Bit 3: 0	EPTADDR	0x0	rw	Endpoint address

21.5.2 USBFS control register (USBFS_CTRL)

Bit	Register	Reset value	Type	Description
Bit 15	TCIEN	0x0	rw	Transmission complete interrupt enable 0: Disabled 1: Enabled
Bit 14	UCFORIEN	0x0	rw	USB Core fifo overrun interrupt enable 0: Disabled 1: Enabled
Bit 13	BEIEN	0x0	rw	Bus error interrupt enable 0: Disabled 1: Enabled
Bit 12	WKIEN	0x0	rw	Wakeup/Remote wakeup interrupt enable 0: Disabled 1: Enabled。
Bit 11	SPIEN	0x0	rw	Bus suspend interrupt enable 0: Disabled 1: Enabled
Bit 10	RSTIEN	0x0	rw	Bus reset interrupt enable 0: Disabled 1: Enabled
Bit 9	SOFIEN	0x0	rw	Start of frame interrupt enable 0: Disabled 1: Enabled
Bit 8	LSOFIEN	0x0	rw	Lost start of frame interrupt enable 0: Disabled

				1: Enabled
Bit 7: 5	Reserved	0x0	resd	Kept at its default value.
Bit 4	GRESUME	0x0	rw	Generate Resume request In suspend mode, the software can set this bit to send a resume signal to the host in order to wake up it. It must be cleared between 10ms and 15ms.
Bit 3	SSP	0x0	rw	Software suspend config This bit is set by software when a suspend flag is detected. When exiting suspend state, this bit must be cleared by software. 0: Software leaves suspend mode 1: Software enters suspend mode
Bit 2	LPM	0x0	rw	Low power mode While entering suspend mode, this bit can be set to reduce power consumption. It is cleared automatically when the USB Core is waken up. 0: No low-power mode 1: Low-power mode
Bit 1	DISUSB	0x1	rw	Disble USB PHY 0: USB PHY enabled 1: USB PHY disabled
Bit 0	CSRST	0x1	rw	Core soft Reset 0: Software clears reset 1: Software resets usb core, and a reset interrupt is generate.

21.5.3 USBFS interrupt status register (USBFS_INTSTS)

Bit	Register	Reset value	Type	Description
Bit 15	TC	0x0	ro	Transaction completed 0: Reset value 1: This bit is set to indicate that the USB has successfully completed one IN/OUT transaction
Bit 14	UCFOR	0x0	rw0c	USB Core fifo overrun 0: Reset value 1: USB Core fifo overrun
Bit 13	BE	0x0	rw0c	Bus error 0: Reset value 1: Bus error detected, such as, CRC check error, bit-stuffing error, Answer timeout error and frame format error.
Bit 12	WK	0x0	rw0c	Wakeup 0: Reset value 1: A wakeup signal is received when the USB is in suspend state.
Bit 11	SP	0x0	rw0c	Bus Suspend 0: Reset value 1: No data transfer has been received for 3ms, and the bus enters suspend state.
Bit 10	RST	0x0	rw0c	Bus reset 0: Reset value 1: A USB reset signal was detected on the bus.
Bit 9	SOF	0x0	rw0c	Start of frame 0: Reset value 1: This bit is set to indicate that a SOF transaction arrives through the bus.
Bit 8	LSOF	0x0	rw0c	Lost start of frame

				0: Reset value 1: No SOF has been received for more than 1ms.
Bit 7: 5	Reserved	0x0	resd	Kept at its default value.
Bit 4	INOUT	0x0	ro	IN/Out transaction When TC complete interruput is generated, this bit is used to indicate whether IN/OUT transcation has been completed. 0: IN transaction 1: OUT transaction
Bit 3: 0	EPT_NUM	0x0	ro	Endpoint number When TC complete interruput is generated, this bit is used to indicate which endpoint transfer has been completed successfully.

21.5.4 USBFS SOF frame number register (USBFS_SOFRNUM)

Bit	Register	Reset value	Type	Description
Bit 15	DPSTS	0x0	ro	D+ status Indicates D+ status
Bit 14	DMSTS	0x0	ro	D- status Indicates D- status
Bit 13	CLCK	0x0	ro	Connect Locked This bit is set when two consecutive SOF packets have been received.
Bit 12: 11	LSOFNUM	0x0	ro	Lost SOF number After LSOF, this bit indicates the number of SOF packet lost. It is cleared by hardware at the reception of an SOF transaction.
Bit 10: 0	SOFNUM	0xXXX	ro	Start of Frame number Indicates the current SOF frame number.

21.5.5 USBFS device address register (USBFS_DEVADDR)

Bit	Register	Reset value	Type	Description
Bit 15: 8	Reserved	0x00	resd	Kept at its default value
Bit 7	CEN	0x0	rw	USB Core Enable 0: USB Core disabled 1: USB Core enabled
Bit 6: 0	ADDR	0x00	rw	Host assign Device address These bits contain the device address assigned by the host during the enumeration process.

21.5.6 USBFS buffer table address register (USBFS_BUFTBL)

Bit	Register	Reset value	Type	Description
Bit 15: 3	BTADDR	0x0000	rw	Endpoint buffer table start address This field indicates the start address of the buffer description table. It is 0 by defauly.
Bit 2: 0	Reserved	0x0	resd	Forced to 0 by hardware.

21.5.7 USBFS CFG control register (USBFS_CFG)

Bit	Register	Reset value	Type	Description
Bit 15: 2	Reserved	0x0000	resd	Kept at its default value.
Bit 1	PUO	0x0	rw	DP pull-up off 0: DP pull-up resistance enabled 1: DP pull-up resistance disabled
Bit 0	SOFOUTEN	0x0	rw	SOF output enable

				0: No SOF pulse output 1: SOF pulse output to the pin

21.5.8 USBFS transmission buffer first address register (USBFS_TnADDR)

Bit	Register	Reset value	Type	Description
Bit 15: 1	TnADDR	0xXXXX	rw	Transmission buffer first address This field indicates the start address of the buffer where data is to be transmitted at the reception of the next IN transaction request..
Bit 0	Reserved	0x0	resd	This bit must be 0 since the address of the packet buffer must be word-aligned.

21.5.9 USBFS transmission data length register (USBFS_TnLEN)

Bit	Register	Reset value	Type	Description
Bit 15: 10	Reserved	0xXX	resd	Kept at its default value.
Bit 9: 0	TnLEN	0xXXX	rw	Transmission length This field contains the number of data bytes to be transferred at the reception of the next IN transaction request.

21.5.10 USBFS reception buffer first address register (USBFS_RnADDR)

Bit	Register	Reset value	Type	Description
Bit 15: 1	RnADDR	0xXXXX	rw	Reception buffer first address This field indicates the start address of the buffer where data is to be received at the reception of the next OUT/SETUP transaction request..
Bit 0	Reserved	0x0	resd	This bit must be 0 since the address of the packet buffer must be word-aligned.

21.5.11 USBFS reception data length register (USBFS_RnLEN)

Bit	Register	Reset value	Type	Description
Bit 15	BSIZE	0xX	rw	Block size This bit indicates the size of the reception buffer ot he current endpoint. If BSIZE=0, the block size is 2 byte large, and the the size of the packet buffer ranges from 2 to 62 bytes. If BSIZE=1，the block size is 32 byte large, and the size of the packet buffer ranges from 32 to 1024 bytes.
Bit 14: 10	NBLK	0xXX	rw	Number of blocks This field defines the number of blocks allocated to the current endpoint reception buffer.
Bit 9: 0	RnLEN	0xXXX	rw	Reception Length This field defines the data length received by the endpoint.

22 HICK auto clock calibration (ACC)

22.1 ACC introduction

HICK auto clock calibration (HICK ACC) implements the sampling and calibration for the HICK clocks by using the SOF signal (1 ms of period) generated by USB module as a reference signal.

The main pupose of this module is to provide a clock of 48MHz±0.25% for the USB device.

It is able to make the calibrated frequency as close to the target frequency as possible by means of “cross and return” algorithm.

22.2 Main features

- Programmable center frequency
- Programmable boundary frequency that triggers calibration function
- Center frequency precision ±0.25%
- Status detection flags
  - Calibration ready flag
- Error detection flags
  - Reference signal lost error flag
- Two interrupt source flag
  - Calibration ready flag
  - Reference signal lost error flag
- Two calibration modes: coarse calibration and fine calibration

22.3 Interrupt requests

Table 22-1 ACC interrupt requests

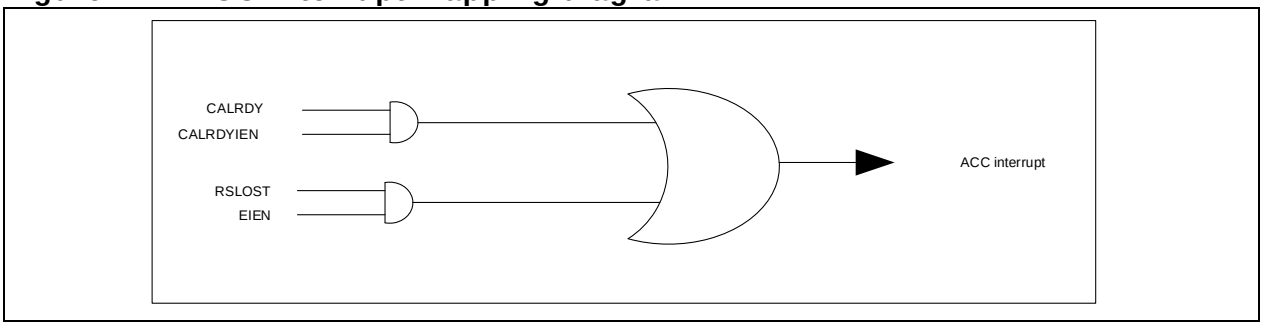
Interrupt event	Event flag	Enable bit
Calibration ready	CALRDY	CALRDYIEN
Reference signal lost	RSLOST	EIEN

ACC interrupt events are linked to the same interrupt vector (see *Figure 22-1*). Interrupt events include:

- During calibration period: When the calibration gets ready or reference signal lost occurs,

the corresponding interrupt will be generated if the corresponding enable bit is enabled.

Figure 22-1 ACC interrupt mapping diagram



22.4 Functional description

Auto clock calibration (HICK ACC): implements the sampling and calibration for the HICK clocks by using the SOF signal (1 ms of period) generated by USB module as a reference signal. In particular, the HICK clock frequency can be calibrated to a precision of ±0.25% so as to meet the needs of the high-precision clock applications such as USB.

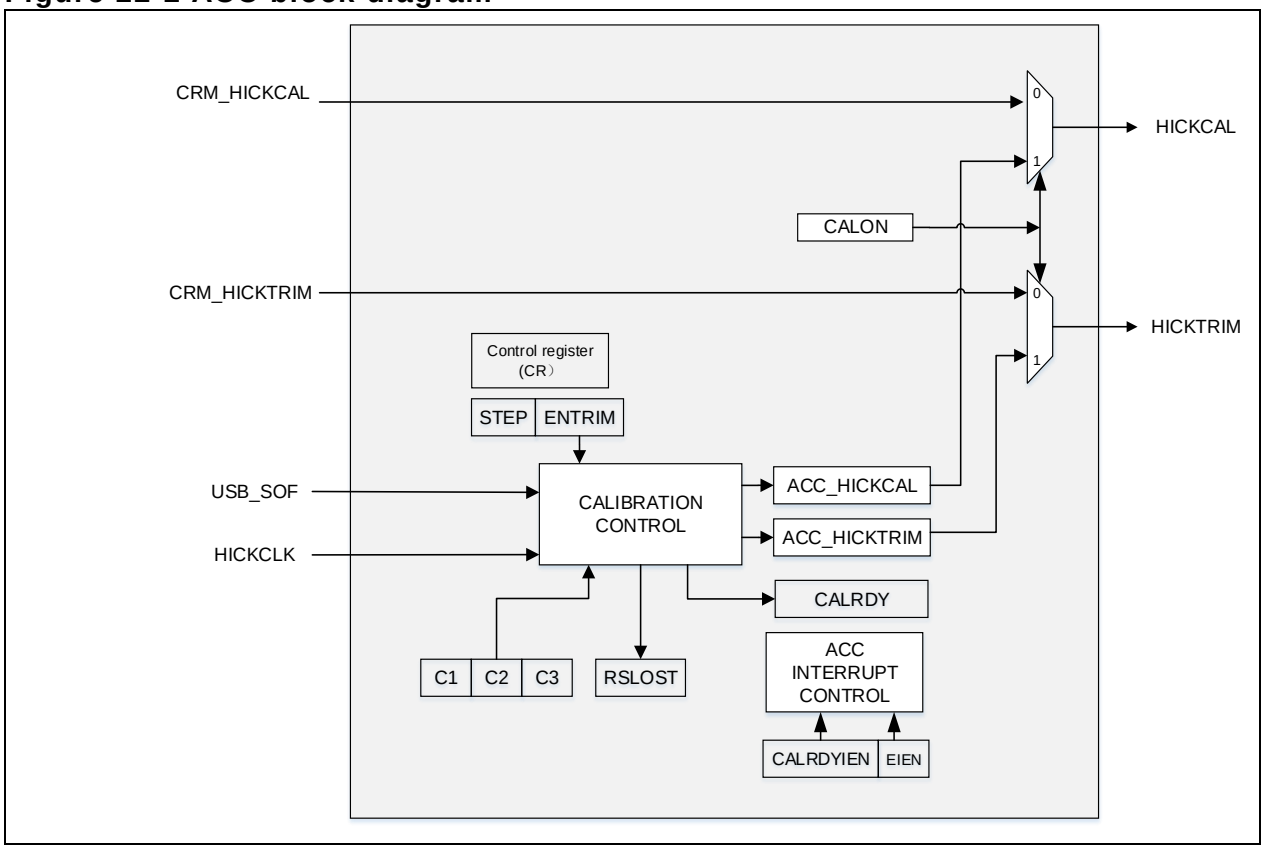
The signals of the module are connected to the CRM and HICK inside the microcontroller instead of being connected to the pins externally.

- **CRM_HICKCAL:** the HICKCAL bit in the CRM module. This signal is used to calibrate the HICK in bypass mode. The value is defined by the HICKCAL[7: 0] in the CRM_CTRL register.
- **CRM_HICKTRIM:** the HICKTRIM bit in the CRM module. This signal is used to calibrate the HICK in bypass mode. The value is defined by the HICKTRIM[5: 0] in the CRM_CTRL register.

  The default value of the HICk is 32, which can be calibrated to 8MHz±0.25%. The HICK frequency can be adjusted by 20kHz (design value) each time when the CRM_HICKTRIM value changes.
- **USB_SOF**: USB Start-of-Frame signal given by the USB device. Its high-level width is 12 system clock cycles, a pulse signal of 1 ms.
- **HICKCLK:** HICK clock. The original HICK output frequency is 48MHz, but the sampling clock used by the HICK calibration module is frequency divider (1/6) clock, about 8MHz.
- **HICKCAL:** HICK module calibration signal. For the HICK clock after frequency division (1/6), the HICK clock frequency will change by 40KHz (design value) each time the HICKCAL changes, which is positively correlated. In other words, the HICK clock frequency will incease by 40KHz (design value) eac time the HICKCAL is incremented by one; the HICK clock frequency will reduce by 40KHz each time the HICKCAL is decremented by one.
- **HICKTRIM:** HICK module calibration signal. For the HICK clock after frequency divion (1/6), the HICK clock frequency will change by 20KHz (design value) each time the HICKCAL changes, which is positively correlated.

Refer to *Section 22.6* for more information about the bit definition in the registers.

Figure 22-2 ACC block diagram

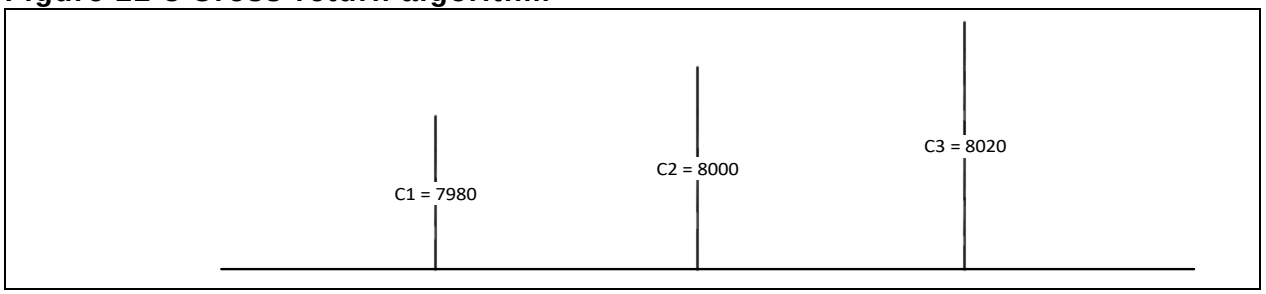


22.5 Principle

USB_SOF period signal: 1ms of period must be accurate, which is a prerequisite of the normal operaion of an auto calibration module.

Cross-return algorithm: This is used to calculate a calibration value closest to the theoretic value. In theory, the actual frequency after calibration can be adjusted to be within an accuracy range of about 0.5 steps from the target frequency (8MHz)

Figure 22-3 Cross-return algorithm



From the above figure, auto calibration function will adjust the HICKCAL or HICKTRIM according to the specified step as soon as the condition for trigerring auo calibration is reached.

Cross:

When the auto calibration condition is met, the actual sampling data within the first 1ms period will be either less than C2, or greater than C2.

When this value is less than C2, the auto calibration module will start increasing either the HICKCAL or HICKTRIM according to the step definition until the actual sampling value is greater than C2. In this way, the actual value will cross over C2 from small to large.

When this value is greater than C2, the auto calibration module will start decrease either the HICKCAL or HICKTRIM according to the step definition until the actual sampling value become less than C1. In this way, the actual value will cross over C2 from large to small.

Return:

After cross operation is completed, the actual value closest to C2 can be obtained by comparing the difference (calculated as absolute value) between the actual sampling value and C2 before and after crossing C2 so as to get the best calibration value HICKCAL or HICKTRIM.

If the difference after crossing is less than the one before crossing C2, the calibration value after crossing prevails, and stops the calibration process until the next condition for auto calibration appears.

If the difference after crossing is greater than the one before crossing C2, the calibration value before crossing prevails, and it will return by one step to the one before crossing, and stops the calibration process until the next condition for auto calibration appears.

According to the cross-return strategy, in theory, it is possible to get the frequency accuracy that is 0.5 steps away from the center frequency.

Four conditions for enabling auto calibration function are as follows:

1. The rising edge of the CANLON (from 0 to 1)
2. When CALON=1, reference signal is lost and restored
3. When the sample counter is less than C1
4. When the sample counter is greater than C3

Even though the sampling counter is between C1 and C3, at the rising edge the CANLON, the auto calibration module can also be activated so that the HICK frequency can be adjusted to be within a range of 0.5 steps of the center frequency as soon as the CANLON is enabled.

Under one of the above-mentioned circumstances, the HICK frequency cal be calibrated to be within 0.5 steps of the center frequency. To achieve the best calibration accuracy, it is recommended to remain step as 1 (defual value). If the steop is set to 0, either HICKCAL or HICKTRIM will not be able to be calibrated.

22.6 Register description

Refer to Section 1.2 for list of abbreviations used in register descriptions.

These peripheral registers must be accessed by words (32 bits).

Table 22-2 ACC register map and reset values

Register	Offset	Reset value
ACC_STS	0x00	0x0000 000
ACC_CTRL1	0x0C	0x0000 0100
ACC_CTRL2	0x0C	0x0000 2080
ACC_C1	0x0C	0x0000 1F2C
ACC_C2	0x10	0x0000 1F40
ACC_C3	0x14	0x00000 1F54

22.6.1 Status register (ACC_STS)

Bit	Register	Reset value	Type	Description
Bit 31: 2	Reserved	0x0000000	resd	Kept at its default value.
Bit 1	RSLOST	0x0	ro	Reference Signal Lost 0: Reference Signal is not lost 1: Reference Signal is lost Note: During the calibration, when the sample counter of the calibration module is twice that of C2, if a SOF reference signal is not detected, it means that the reference signal is lost. The internal statue machine will move to the idle state unless another SOF signal is detected, otherwise, the interal clock sample counter remains 0. The RSLOST bit is immediately cleared after the CALON bit is cleared or when the RSLOST is written with 0. Reference signal detection occurs only when

				CALON=1.
Bit 0	CALRDY	0x0	ro	Internal high-speed clock calibration ready 0: Interal 8MHz oscillator calibration is not ready 1: Interal 8MHz oscillator calibration is ready Note: This bit is set by hardware to indicate that internal 8MHz oscillator has been calibrated to the frequency closest to 8MHz. The CALRDY is immediately cleared after the CALON bit is cleared or when the CALRDY is written with 0.

22.6.2 Control register 1 (ACC_CTRL1)

Bit	Register	Reset value	Type	Description
Bit 31: 12	Reserved	0x00000	resd	Forced by hardware to 0
Bit 11: 8	STEP	0x1	rw	Calibrated step This field defines the value after each calibration. Note: It is recommended to set the step bit in order to get a more accurate calibration result. While ENTRIM=0, only the HICKCAL is calibrated. If the step is incremented or decremented by one, the HICKCAL will be incremented or decremented by one accordingly, and the HICK frequency will increase or decrease by 40KHz (design value). This is a positive relationship. While ENTRIM=1, only the HICKTRIM is calibrated. If the step is incremented or decremented by one, the HICKTRIM will be incremented or decremented by one accordingly, and the HICK frequency will increase or decrease by 20KHz (design value). This is a positive relationship.
Bit 7: 6	Reserved	0x0	rw	Forced by hardware to 0
Bit 5	CALRDYIEN	0x0	rw	CALRDY interrupt enable This bit is set or cleared by software. 0: Interrupt generation disabled 1: ACC interrupt is generated when CALRDY=1 in the ACC_STS register
Bit 4	EIEN	0x0	rw	RSLOST error interrupt enable This bit is set or cleared by software. 0: Interrupt generation disabled 1: ACC interrupt is generated when RSLOST=1 in the ACC_STS register
Bit 3: 2	Reserved	0x0	rw	Forced by hardware to 0
Bit 1	ENTRIM	0x0	rw	Enable trim This bit is set or cleared by software. 0: HICKCAL is calibrated. 1: HICKTRIM is calibrated. Note: It is recommended to set ENTRIM=1 in order to get higher calibration accuracy.
Bit 0	CALON	0x0	rw	Calibration on This bit is set or cleared by software. 0: Calibration disabled 1: Calibration enabled, and starts searching for a pulse on the USB_SOF. Note: This module cannot be used without the USB_SOF reference signal. If there are no requirements on the accuracy of the HICK clock, it is unnecessary to enable this module.

22.6.3 Control register 2 (ACC_CTRL2)

Bit	Register	Reset value	Type	Description
Bit 31: 14	Reserved	0x00000	resd	Forced to 0 by hardware
Bit 13: 8	HICKTRIM	0x00	ro	Internal high-speed auto clock trimming This field is read only, but not written. Internal high-speed clock is adjusted by ACC module, which is added to the ACC_HICKCAL[7: 0] bit. These bits allow the users to input a trimming value to adjust the frequency of the HICKRC oscillator according to the variations in voltage and temperature. The default value is 32, which can trim the HICK to 8MHz±0.25. The trimming value is 20kHz (design value) between two consecutive ACC_HICKTRIM steps.
Bit 7: 0	HICKCAL	0x00	ro	Internal high-speed auto clock calibration This field is read only, but not written. Internal high-speed clock is adjusted by ACC module. These bits allow the users to input a trimming value to adjust the frequency of the HICKPC oscillator according to the variations in voltage and temperature. The default value is 128, which can trim the HICK to 8MHz±0.25. The trimming value is 40kHz (design value) between two consecutive ACC_HICKCAL steps.

22.6.4 Compare value 1 (ACC_C1)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Forced to 0 by hardware
Bit 15: 0	C1	0x1F2C	rw	Compare 1 This value is the lower boundary for triggering calibration, and its default value is 7980. When the number of clocks sampled by ACC in 1ms period is less than or equal to C1, auto calibration is triggered automatically. When the actual sampling value (number of clocks in 1ms) is greater than C1 but less than C3, auto calibration is not enabled.

22.6.5 Compare value 2 (ACC_C2)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Forced to 0 by hardware
Bit 15: 0	C2	0x1F40	rw	Compare 2 This value defines the number of clocks sampled for 8MHz (ideal frequency) clock in 1ms period , and its default value is 8000 (theoretical value) As a center point of cross-return strategy, this value is used to calculate the calibration value closest to the theoretical value. In theory, the actual frequency after calibration can be trimmed to be within an accuracy of 0.5 steps from the targe frequency (8MHz)

22.6.6 Compare value 3 (ACC_C3)

Bit	Register	Reset value	Type	Description
Bit 31: 16	Reserved	0x0000	resd	Forced to 0 by hardware
Bit 15: 0	C3	0x1F54	rw	Compare 3 This value is the upper boundary for triggering calibration. When the number of clock sampled by ACC in 1ms period is greater than or equal to C3, auto calibration is triggered automatically. When the actual sampling value (number of clocks in 1ms period) is greater than C1 but less than C3, auto calibration is not enabled.

23 SDIO interface

23.1 SDIO introduction

The SD/SDIO MMC card host interface (SDIO) provides an interface between the AHB peripheral bus and MultiMediaCards (MMC), SD memory cards and SDIO cards.

SD memory card and SDI/O card system specifications are available through the SD card association website www.sdcard.org.

The MultiMediaCard system specifications published by the MMCA technical committee are available through the MultiMediaCard association website www.mmca.org.

23.2 SDIO main features

- Full compatibility with SD memory card specifications version 2.0
- Full compatibility with SDI/O card specification version 2.0 and support 1-bit and 4-bit databus modes.
- Full compatibility with MultiMedia card specification version 4.2 and support 1-bit, 4-bit and 8-bit databus modes.
- Full compatibility with previous versions of MultiMedia card specifications
- DMA transfer
- Data transfer up to 50 MHz in 8-bit bus mode
- Interrupt requests

Note: The SDIO is not compatible with SPI communication mode. It supports only one SD/SDIO/MMC 4.2 card at any one time.

Communication on the bus is based on command and data transfers.

- **Command:** A command is a token that starts an operation. Commands are sent from the host to a single card (addressable command) or to all conncected cards (broadcast command). Commands are transferred serially on the CMD line.
- **Response**: A response is a token that is sent from a card to the host as an answer to a previously received command. Responses are transferred serially on the CMD line.
- **Data:** Data can be transferred from the card to the host or vice versa. Data is transferred via the SDIO_D data line.

The basic operation on the MMC card/SD/SDI I/O bus is the command/response structure. These types of bus operation transfer their information through the command or bus mechanism. In addition, some operations have a data token.

Data transfers to/from SD/SDIO memory cards are done in data blocks. Data blocks are always followed by CRC bit, defining single and multiple block operations. Data transfers to/from MMC are done in data blocks or streams, as shown in Figure below.

Figure 23-1 SDIO “no response” and “no data” operations

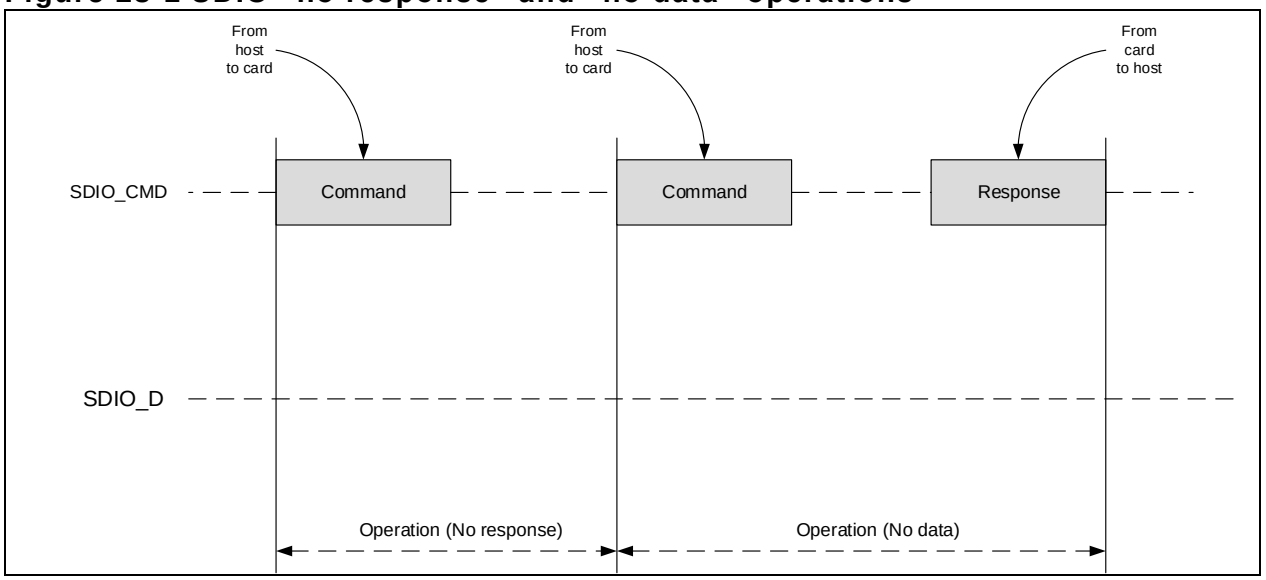


Figure 23-2 SDIO multiple data block read operation

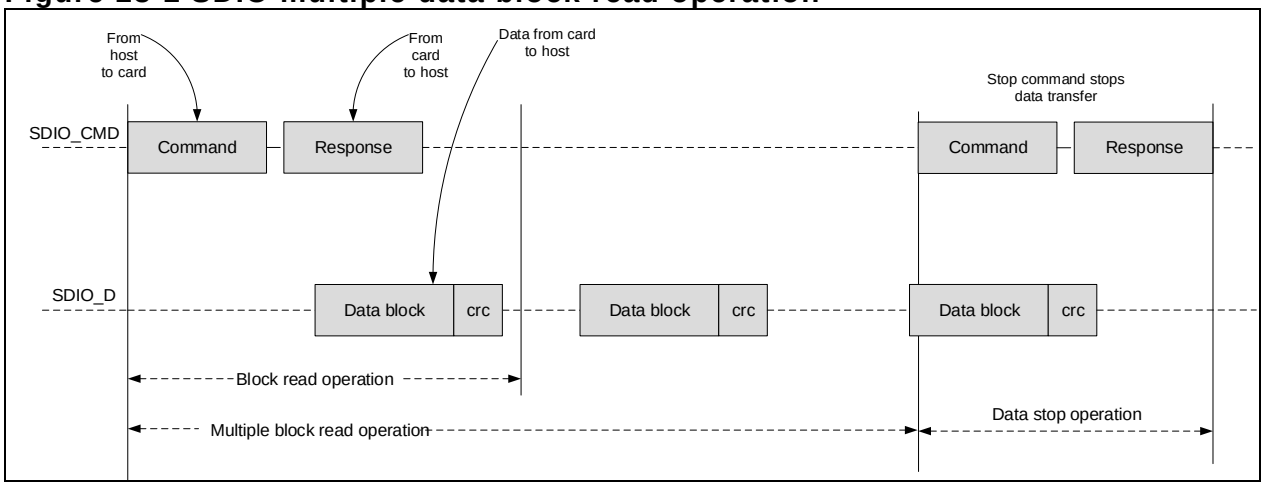

Figure 23-3 SDIO multiple data block write operation

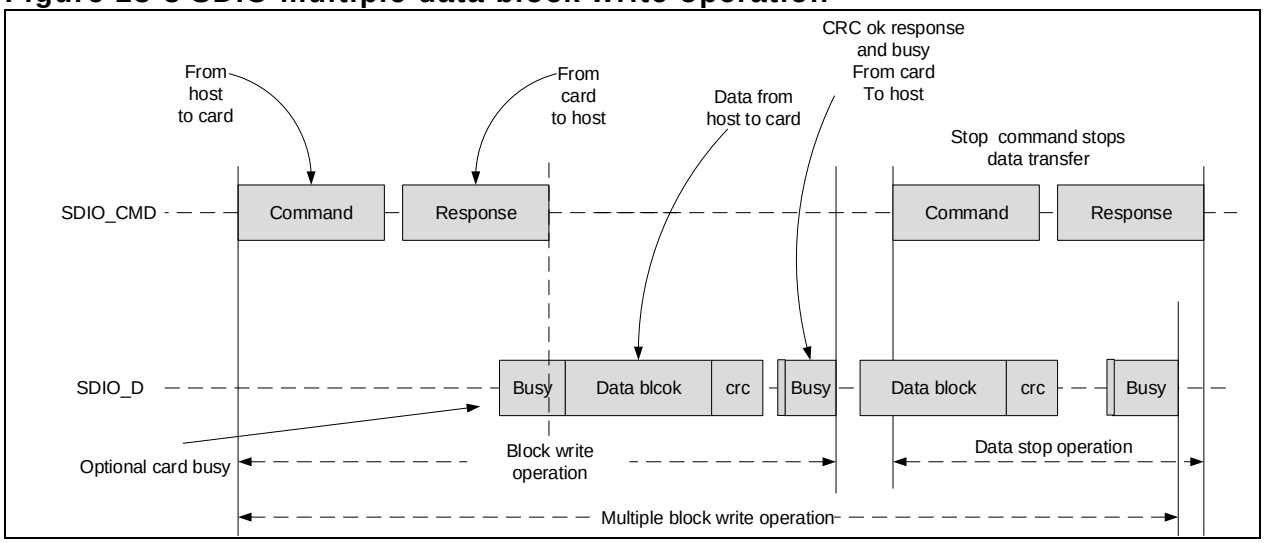

Note: The SDIO will not send any data as long as the Busy signal is set (SDIO_D0 pulled low).

Figure 23-4 SDIO sequential read operation

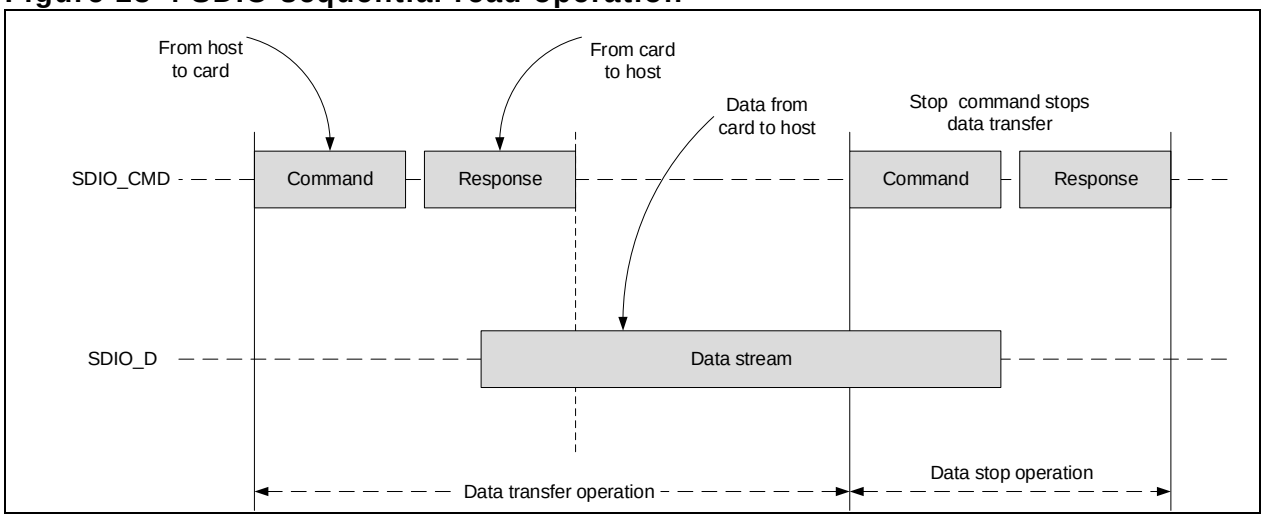

Figure 23-5 SDIO sequential write operation

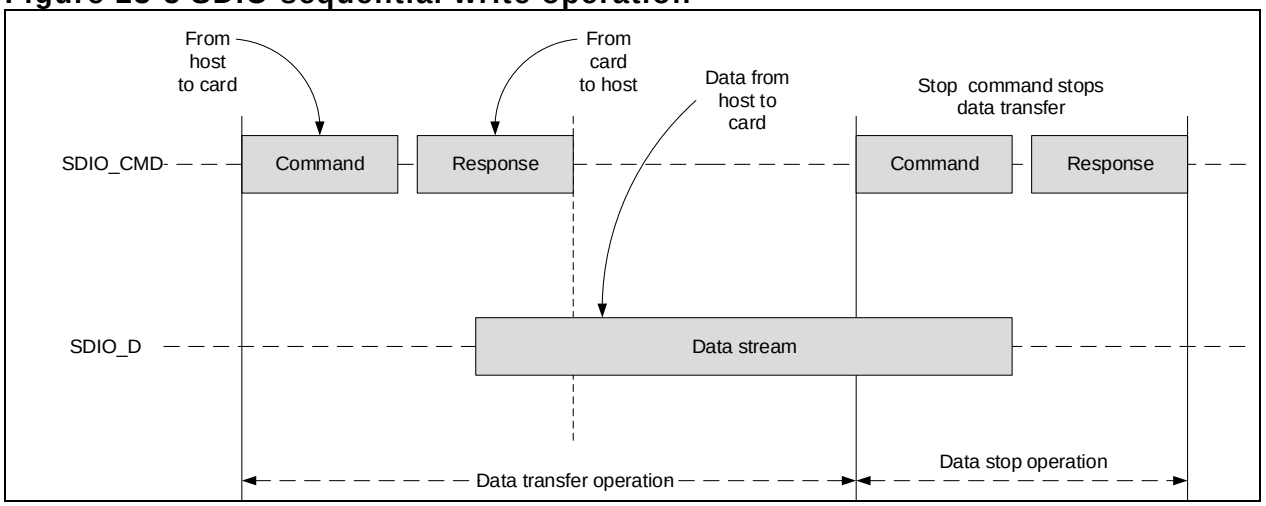


23.3 SDIO main features

23.3.1 Card functional description

All the communications between the host and the cards are controlled by the card. The host sends two different types of commands: broadcast command and addressible (point-to-point) command.

- Broadcast command: applicable to all cards, some need responses
- Addressible command: send to the addressible card, and response response from the card

Memory card defines two types of operational modes:

- Card identification mode
- Data transfer mode

23.3.1.1 Card identification mode

In card indentification mode, the host resets all cards, validates the operation voltage range, identifies cards and sets a relative card address (RCA) for each card on the CMD. All communications in the card identification mode use the command line (CMD).

Card identification process

The card identification process varies from card to card, and the host sends different commands. There are SD, SDI/O and MMC cards. It is possible to send a CMD5 command to identify the type of a card. If the host receives a response, it is a SDI/O card. If no response is received, the host will continue to send ACMD41 command, if a response is received, it is a SD card, otherwise a MMC card.

The card identification process is described as follows:

1. The bus is activated to confirm whether the card is connected or not. The clock frequency is at 0-400kHz during the card identification process.
2. The SDIO host sends a SD card, SDI/O card or MMC card.
3. Card Initialization
   - SD card: The SDIO host sends CMD2 (ALL_SEND_CID) to obtain its unique CID number. After receiving a response (CID number) from the card, the host will send CMD3 (SEND_RELATIVE_ADDR), instructing the card to issue the relative card address (RCA), which is shorter than the CID and is used to address the card in the data transfer mode.
   - SDI/O card: The SDIO host sends CMD3 (SEND_RELATIVE_ADDR) to instruct the card to release the relative card address (RCA), which is shorter than the CID and is used to address the card in the data transfer mode.
   - MMC card: The SDIO host sends CMD1 (SEND_OP_COND), followed by CMD2 and CMD3.
4. If the host wants to assign another RCA number, it can instruct the card to issue a new number by sending another CMD3 command. The last RCA is the actual RCA number of the card. The host repeats the card indetification process (CMD2 and CMD3 cycle of each card)

23.3.1.2 Data transfer mode

The host will enter data transfer mode after identifying all cards on the bus. In data transfer mode, the host can operate cards within the range of 0 - 50MHz. It can send CMD9 (SEND_CSD) to get data specific to a card (CSD register) such as block length and car memory size. All communications between the host and the selected card are point-to-point transferred, and the CMD bus will confirm all addressed commands as a response. Data transfer read/write can be done in data block mode or stream mode, configured by the TFRMODE bit in the SDIO_DTCTRL register. In the data stream mode, data is transferred in bytes and without CRC appended to the end of each data block.

Wide bus selection/deselection

Wide bus (4-bit bus width) operation mode is selected or deselected by using ACMD6 (SET_BUS_WIDTH). The default bus width after power-up or CMD0 (GO_IDLE_STATE) is 1 bit. The ACMD6 is only valid in a transfer state, indicating that the bus width can be changed only after a card is selected by CMD7.

Stream read/write (MultiMedia card only)

Read**:**

1. The host sends CMD11 (READ_DAT_UNTIL_STOP) for stream read.
2. Until the host sends CMD12 (STOP_TRANSMISSION). The stop command has an execution delay due to the serial command transmission and the data transfers stops after the end bit of the the stop command.

Write:

1. The host sends CMD20 (WRITE_DAT_UNTIL_STOP) for stream write.
2. Until the host sends CMD12 (STOP_TRANSMISSION). As the amount of data to be transferred is not determined in advance, the CRC cannot be used. When the memory range is reached, the command will be discarded by the card and remain in a transfer state, and a respons is issued by setting the ADDRESS_OUT_OF_RANGE bit.

Data block read

In block read mode, the basic unit of data transfer is a block whose maximum size (fixed length 512 bytes) is defined in the CSD (READ_BL_LEN). If the READ_BL_PARTIAL is set, smaller blocks whose start and end addresses are entirely contained within 512 bytes may also be transmitted. A CRC is appended to the end of each block to ensuring data transfer integrity. Several commands related to data block read are as follows:

- CMD17 (READ_SINGLE_BLOCK): initiates a data block read and returns to the transfer state after the completion of the transfer.
- CMD18 (READ_MULTIPLE_BLOCK): starts a transfer of several consecutive data blocks.

Data blocks will keep transferring until the host sends CMD12(STOP_TRANSMISSION). The stop command has an execution delay due to the serial command transmission and the data transfers stops after the end bit of the the stop command.

Data block write

During block write (CMD24-27), one or more blocks of data are transferred from the host to the card with a CRC appended to the end of each block. If the CRC failed, the card indicates a failure on the SDIO_D signal line and the transferred data are discarded and not written, and all transmitted data blocks are ignored.

If the host uses partial blocks with accumulated length is not block aligned, and block misalignment is not allowed (CSD parameter WRITE_BLK_MISALIGN is not set), the card will detect the block misalignment error before the beginning of the first misaligned block. The card sets the ADDRESS_ERROR bit in the SDIO_STS register and waits the stop command in a receive state while ignoring all further data transfer. If the host attempts to perform write operation on a write-protected area, the write operation will be aborted. In this case, however, the card should set the WP_VIOLATION bit.

Programming of the CID and CSD registers does not require a block length setting in advance. The transferred data is also CRC protected. If a part of the CSD or CID register is stored in the ROM, then the unchangeable part must match the corresponding part of the receive buffer. If this match failed, then the card will report an error and does not change any register contents. Some cards may require long and unpredictable times to write a block of data. After receiving a block of data and completing the CRC check, the card begins writing and holds the SDIO_D signal line low if its write buffer is full and unable to accect new data from a new WRITE_BLOCK command. The host can check the status of the card with SEND_STATUS command (CMD13) at any time, and the card will respond with its status.

The READY_FOR_DATA status bit indicates whether the car can accept new data or whether the write process in still in progress. The host can deselect the card by issuing CMD7 (select another card), which will place the card in the disconnect state and release the SDIO_D line without interrupting the write operation. when reselecting the card, it will reactivate busy indication by pulling SDIO_D line to low if the programming is still in progress and the write buffer is unavailable.

23.3.1.3 Erase

The erasable unit of the MultiMedia card and SD card is the erase group. The erase group is calculated in wirte blocks, which are the basic writble units of the card. The size of the erase group is a parameter specific to the card and defined in the CSD.

The host can erase a contiguous range of erase groups. There are three steps to start the erase process, but the commands sent by the MultiMedia card and SD card are different.

1. The host defines the start address of the range using the following command:
   - SD card: issue CMD32 (ERASE_WR_BLK_START)
   - MMC car: issue CMD35 (ERASE_GROUP_START)
2. The host defines the end address of the rang using the following command:
   - SD card: issue CMD33 (ERASE_WR_BLK_END)
   - MMD car: issue CMD36 (ERASE_GROUP_END)
3. The host starts the erase process by sending CMD38 (ERASE)

23.3.1.4 Protection management

Three write protection methods are supported in the SDIO card host module to ensure that the protected data is not erased or changed.

Mechanical write protect switch

There is a mechanical sliding switch on the side of the card to allow the user to set/clear the write protection on the card. When the sliding switch is positioned with the window open, the card is write-protected, and when the window is closed, the card is not write-protected.

Internal card write protection

Card data can be protected against write and erase. The entire card can be permanently write-protected by the manufacturer or the content provider by setting the permanent or temporary write-protect bits in the CSD. For cards that support write protection of groups of sectors by setting the WP_GRP_ENABLE

bit in the CSD, part of the data can be protected, and the write protection can be changed by the application. The SET_WRITE_PROT commands set the write protection of the addressed group. The CLR_WRITE_PROT commands clear the write protection of the addressed group. The SEND_WRITE_PROT command is similar to a single block read command. The card sends a data block containing 32 write protection bits (representing 32 write protect groups starting at the specified address) followed by 16 CRC bits. The address filed in the write protect commands is a group address in byte units.

Password protect

The password protection function enables the SDIO card host to lock and unlock a card with a password. The password is stored in the 128-bit PWD register and its size is set in the 8-bit PWD_LEN register. These registers are nonvolatile so that the content is not erased after power-off.

Locked cards can support certain commands, indicating that the host is allowed to reset, initialize and query for status, but not allowed to access data on the card. When the password is set (PWD_LEN is nonzero value), the card is locked automatically after power-up.

Like the CSD and CID register write commands, the lock/unlock commands are valid only in a transfer state. The command does not include an address parameter and thus the card must be selected before using it.

The card lock/unlock commands have the structure and bus transaction types of a regular single-block write command. The transferred data block include all the information required for the command (the password setting mode, PWD content and card lock/unlock indication). The command data block size is defined by the SDIO card host module before it sents the card lock/unlock command. The lock/unlock command structure is shown below:

Table 23-1 Lock/unlock command structure

Byte	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
0	Reserved(set to 0)				ERASE	LOCK_UNLOCK	CLR_PWD	SET_PWD
1	PWDS_LEN							
2	password data							
…								
PWDS_LEN+1								

- ERASE: Setting this bit will force an erase operation. All other bits must be zero, and only the command byte is sent.
- LOCK_UNLOCK: Setting this bit will lock the card. Clearing it will unlock the card. LOCK_UNLOCK can be set simultaneously with SET_PWD, but not with the CLR_PWD.
- CLR_PWD: Setting this bit will clear the password data.
- SET_PWD: Setting this bit will save the password data to memory.
- PWD_LEN: This bit defines the length of the password in bytes. When the password is changed, the length is the combination of the old and new passwords.
- PWD: password (new or currently used, depending on the command)

  The data block size should be defined by the host before it sends the card lock/unlock command. The block length should be equal to or greater than the data structure required for the lock/unlock command.

The following sections list the command sequence to set/clear a password, lock/unlock a card, and force an erase operation.

Setting password

1. Select a card using CMD7 (SELECT/DESELECT_CARD), if none is selected previously
2. Define the block length with CMD16(SET_BLOCKLEN) to send in the 8-bit card lock/unlock mode, 8-bit PWD_LEN, and the number of bytes of the new password. When a password is replaced, the block size must take into account the length of both the old and the new passwords sent with the command.
3. Send CMD42(LOCK/UNLOCK) with the appropriate data block size on the data line including the 16-bit CRC. The data block indicates the operation mode (SET_PWD=1), the length (PWD_LEN) and the password (PWD). When a password replacement is done, the length value includes the length of the both passwords, the old and the new one, and the PWD field includes the old

password (currently used) followed by the new password.

4. When the old password is matched, the new password and its size are saved into the PWD and PWD_LEN fields, respectively. When the old password sent is not correct (in size and/or content), the LOCK_UNLOCK_FAILED error bit is set in the SDIO_STS register, and the old password is not changed. When the old password sent is correct (in size and content), the given new password and its size will be saved in the PWD and the PWD_LEN registers, respectively.

The password length field (PWD_LEN) indicates whether a password is currently set or not. When the field is a zero value, it means that a password is not set currently. When the field is nonzero, it means that a password is set and the card locks itself after power-up. It is possible to lock the card immediately in the current power session by setting the LOCK_UNLOCK bit or sending an additional card lock command.

Clearing password

1. Select a card using CMD7 (SELECT/DESELECT_CARD), if none is selected previously.
2. Define the block length with CMD16(SET_BLOCKLEN) to send in the 8-bit card lock/unlock mode, 8-bit PWD_LEN, and the number of bytes of the new password.
3. Send CMD42(LOCK/UNLOCK) with the appropriate data block size on the data line including the 16-bit CRC. The data block indicates the operation mode (SET_PWD=1), the length (PWD_LEN) and the password (PWD). When a password is matched, the PWD field is cleared and PWD_LEN is set to 0. If the password sent does not correspond to the expected password (in size and/or content), the LOCK_UNLOCK_FAILED error bit is set in the SDIO_STS register, and the password is not changed.

Locking a card

1. Select a card using CMD7 (SELECT/DESELECT_CARD), if none is selected previously.
2. Define the block length with CMD16(SET_BLOCKLEN) to send in the 8-bit card lock/unlock mode, 8-bit PWD_LEN, and the number of bytes of the new password.
3. Send CMD42(LOCK/UNLOCK) with the appropriate data block size on the data line including the 16-bit CRC. The data block indicates the operation mode (SET_PWD=1), the length (PWD_LEN) and the password (PWD).
4. When a password is matched, the card is locked and CARD_IS_LOCKED is set in the SDIO_STS register. If the password sent does not correspond to the expected password (in size and/or content), the LOCK_UNLOCK_FAILED error bit is set in the SDIO_STS register, and the lock fails.

If the password is previously set (PWD_LEN is not 0), the card is locked automatically after power-on reset. An attempt to lock a locked card or to lock a card that does not have a password fails and the LOCK_UNLOCK_FAILED error bit is set in the SDIO_STS register.

Unlocking a card

1. Select a card using CMD7 (SELECT/DESELECT_CARD), if none is selected previously
2. Define the block length with CMD16(SET_BLOCKLEN) to send in the 8-bit card lock/unlock mode, 8-bit PWD_LEN, and the number of bytes of the new password.
3. Send CMD42(LOCK/UNLOCK) with the appropriate data block size on the data line including the 16-bit CRC. The data block indicates the operation mode (SET_PWD=1), the length (PWD_LEN) and the password (PWD).
4. When a password is matched, the card is unlocked and CARD_IS_LOCKED is cleared in the SDIO_STS register. If the password sent does not correspond to the expected password (in size and/or content), the LOCK_UNLOCK_FAILED error bit is set in the SDIO_STS register, and the lock remains locked.

The unlocking function is valid only for the current power session. The card is locked automatically on the next power-up as long as the PWD field is not cleared.

An attempt to unlock an unlocked card fails and the LOCK_UNLOCK_FAILED error bit is set in the SDIO_STS register.

Forcing erase

If the user forgot the password (PWD content), it is possible to access the card after clearing all the data on the card. This forced erase operation will erase all card data and all password data.

1. Select a card using CMD7 (SELECT/DESELECT_CARD), if none is selected previously
2. Define the block length with CMD16(SET_BLOCKLEN) to send in the 8-bit card lock/unlock mode, 8-bit PWD_LEN, and the number of bytes of the new password.
3. Send CMD42(LOCK/UNLOCK) with the appropriate data block size on the data line including the 16-bit CRC. The data block indicates the operation mode (ERASE =1). All other bits must be zero.
4. When the ERASE bit is the only bit in the data field, all card content will be erased, including the PWD and the PWD_LEN field, and the card is no longer locked. When any other bits are not zero, the LOCK_UNLOCK_FAILED error bit is set in the SDIO_STS register, and the card data are retained, and the card remains locked.

An attempt to force erase an unlocked card fails and the LOCK_UNLOCK_FAILED error bit is set in the SDIO_STS register.

23.3.2 Commands and responses

23.3.2.1 Commands

Command types

Four commands are available to control the SD memory card:

1. Broadcast command: sent to all cards, no responses returned
2. Broadcast command with response: sent to all cards, and receive responses from all cards simultaneously
3. Addressible command: sent to the selected card, and no data transfer on the SDIO_D line
4. Addressible data transfer command: sent to the selected card, and data transfer is present on the SDIO_D line

Command description

The SDIO host module system is designed to provide a standard interface for a variety of application types. In the meantime, specific customer/application features must also be taken into account. Because of this, two types of general commands are defined in the standard: general commands (GEN_CMD) and application-specific commands (ACMD).

To use the application-specific commands, the SDIO host must send CMD55(APP_CMD) first, and waits the response from the card, which indicates that the APP_CMD bit is set and an ACMD is expected, before sending ACMD.

Table 23-2 Commands summary

CMD index	Type	Parameter	Response format	Abbreviation	Description
CMD0	bc	[31: 0]=stuff bits	-	GO_IDLE_STATE	Reset all cards to idle state
CMD1	bc	[31: 0]=OCR	R3	SEND_OP_COND	In idle state, request a card to send OCR register content through the CMD bus
CMD2	bcr	[31: 0]=stuff bits	R2	ALL_Send_CID	Request all cards to send CID data through the CMD bus
CMD3	bcr	[31: 0]=stuff bits	R6	SEND_RELATIVE_AD DR	Request a card to issue a new relative card address
CMD4	bc	[31: 16]=DSR [15: 0]= stuff bits	-	SET_DSR	Set the DSR register of all cards
CMD5	bcr	[31: 24]Reserved [23: 0] I/O OCR	R4	IO_SEND_OP_COND	Used only for the SDI/O card to query the voltage range of the required I/O card

CMD6	ac	[31: 26] set to 0 [25: 24] access [23: 16] index [15: 8] value [7: 3] set to 0 [2: 0] command set	R1b	SWITCH	Used only for the MMC card to switch the operation modes or modify the EXT_CSD register
CMD7	ac	[31: 16]=RCA [15: 0]= stuff bits	R1b	SELECT/DESELECT_ CARD	This command is used to switch a card between the standby state and the send state, or between the programmed and the disconnected state. The relative card address is used to select a card. Address 0 is used to deselect the card.
CMD8 (SD)	bcr	[31: 12] Reserved [11: 8]operating voltage (VHS) [7: 0]check mode	R7	SEND_IF_ COND	Send the host power supply voltage to the SD card and check whether the card supports the voltage or not.
CMD8 (MMC)	adtc	[31: 0]= stuff bits	R1	SEND_EXT_ CSD	Used only for the MMC card to send its own EXT_CSD register as a data block
CMD9	ac	[31: 16]=RCA [15: 0]= stuff bits	R2	SEND_CSD	The selected card sends CSD (card-specific data) through the CMD bus
CMD10	ac	[31: 16]=RCA [15: 0]= stuff bits	R2	SEND_CID	The selected card sends CID (card flag) through the CMD bus
CMD12	ac	[31: 0]= stuff bits	R1b	STOP_TRANSMISSION	Force the card to stop transmission
CMD13	ac	[31: 16]=RCA [15: 0]= stuff bits	R1	SEND_ STATUS	Selected card sendstatus register
CMD15	ac	[31: 16]=RCA [15: 0]= stuff bits	-	GO_INACTIVE_ STATE	Selected card switch to inactive state

Table 23-3 Data block read commands

CMD index	Type	Parameter	Response format	Abbreviation	Description
CMD16	ac	[31: 0]=data block length	R1	SET_ BLOCKLEN	This command is used to set the length of data blocks (in bytes) for all block commands. The default value is 512 bytes.
CMD17	adtc	[31: 0]=data address	R1	READ_ SINGLE_ BLOCK	Read a data block of the size set by CMD16
CMD18	adtc	[31: 0]=data address	R1	READ_ MULTIPLE_ BLOCK	Continously read data from the card to the host until the STOP_TRANSMISSION is received

Table 23-4 Data stream read/write commands

CMD index	Type	Parameter	Response format	Abbreviation	Description
CMD11	adtc	[31: 0]= data address	R1	READ_DAT_UNTIL_STOP	Read data stream form the card starting from a given address until the STOP_TRANSMISSION is received.
CMD20	adtc	[31: 0]= data address	R1	WRITE_DAT_UNTIL_STOP	Read data stream form the host starting from a given address until the STOP_TRANSMISSION is received.

Table 23-5 Data block write commands

CMD index	Type	Parameter	Response format	Abbreviation	Description
CMD16	ac	[31: 0]=data block length	R1	SET_BLOCKLEN	This command is used to set the length of data blocks (in bytes) for all block commands. The default value is 512 bytes
CMD23	ac	[31: 16]=set to 0 [15: 0]=data block size	R1	SET_BLOCK_COUNT	Define the number of blocks to be transferred in the data block read/write that follows
CMD24	adtc	[31: 0]=data address	R1	WRITE_BLOCK	Write a data block of the size set by the CMD16
CMD25	adtc	[31: 0]=data address	R1	WRITE_MULTIPLE BLOCK	Continuously write data blocks until the STOP_TRANSMISSION is received
CMD26	adtc	[31: 0]= stuff bits	R1	PROGRAM_CID	Program the card identification register
CMD27	adtc	[31: 0]= stuff bits	R1	PROGRAM_CSD	Program the programmable bits of the CSD

Table 23-6 Block-based write protect commands

CMD index	Type	Parameter	Response format	Abbreviation	Description
CMD28	ac	[31: 0]= data address	R1b	SET_WRITE_PROT	If the card has write protection features, this command sets the write protection bit of the specified group. The properties of write protection are placed in the card-specific area (WP_GRP_SIZE).
CMD29	ac	[31: 0]= data address	R1b	CLR_WRITE_PROT	If the card has write protection features, this command clears the write protection bit of the specified group.
CMD30	adtc	[31: 0]=write protect data address	R1	SEND_WRITE_PROT	If the card has write protection features, this command asks the card to send the status of the write protection bits.

Table 23-7 Erase commands

CMD index	Type	Parameter	Response format	Abbreviation	Description
CMD32 … CMD34	Reserved. These command indexes canot be used in order to maintain backward compatibility with older versions of the MultiMedia card.				
CMD35	ac	[31: 0]=data address	R1	ERASE_GROUP_START	Sets the address of the first erase group within a range to be selecte for erase
CMD36	ac	[31: 0]=data address	R1	ERASE_GROUP_END	Sets the address of the last erase group within a continuous range to be selected for erase
CMD37	Reserved. These command indexes canot be used in order to maintain backward compatibility with older versions of the MultiMedia card.				
CMD38	ac	[31: 0]=stuff bits	R1b	ERASE	Erase all previously selected data blocks

Table 23-8 I/O mode commands

CMD index	Type	Parameter	Response format	Abbreviation	Description
CMD39	ac	[31: 16]=RCA [15]=register write flag [14: 8]=register address [7: 0]=register data	R4	FAST_IO	Used to write and read 8-bit (register) data fields. The command specifies a card and a register and provides the data for writing if the write flag is set. The R4 response contains data read from the specified register. This command accesses application-specific registers that are not defined in the MultiMedia card standard.
CMD40	bcr	[31: 0]=stuff bits	R5	GO_IRQ_STATE	Place the system in the interrupt mode

Table 23-9 Card lock commands

CMD index	Type	Parameter	Response format	Abbreviation	Description
CMD42	adtc	[31: 0]=stuff bits	R1	LOCK_ UNLOCK	Sets/clears the password or locks/unlocks the card. The size of the data block is set by CMD16.

Table 23-10 Application-specific commands

CMD index	Type	Parameter	Response format	Abbreviation	Description
CMD55	ac	[31: 16]=RCA [15: 0]=stuff bits	R1	APP_CMD	Indicates to the card that the next command is an application-specific command rather than a standard command.
CMD56	adtc	[31: 1]=stuff bits [0]=RD/WR	R1	GEN_CMD	Used either to transfer a data block to the card or to read a data block from the card for general-purpose/application-specific commands. The size of the data block is defined by the SET_BLOCK_LEN command.
CMD57 … CMD59	Reserved.				
CMD60 … CMD63	Reserved for manufacturer				

23.3.2.2 Response formats

All responses are sent via the CMD bus. The response transmission always starts with the left bit of the bit string corresponding to the response code word. The length depends on the response type.

A response always starts with a start bit (always 0), folled by the transmission bit indicating the direction of transmission (card =0). A value denoted by – in the tables below stands for a variable entry. All responses, except the R3 response type, are protected by a CRC. Every command code word is terminated with the end bit (always 1).

23.3.2.2.1 R1 (normal response command)

Code length = 48 bits. The 45:40 bits indicate the index of the command to be responded to. This value is interpreted as a binary-coded number (between 0 and 63). The status of the card is coded in 32 bits. Note that if it involves a data transfer to a card, a busy signal may appear on the data line after each data block is transmitted. The host should check the busy signal after data block transfer.

Table 23-11 R1 response

Bit	47	46	[45: 40]	[39: 8]	[7：1]	0
Field width	1	1	6	32	7	1
Value	0	0	-	-	-	1
Description	Start bit	Transmission bit	Command index	Card status	CRC7	End bit

23.3.2.2.2 R1b

It is the same as R1 with an optional busy signal transmitted on the data line. The card may become busy after receiving these commands based on its state prior to the command reception. The host should check the busy signal.

23.3.2.2.3 R2 (CID & CSD registers)

Code length = 136 bits. The contents of the CID register are sent as a response to the CMD2 and CMD10 commands. The contents of the CSD register are sent as a response t the CMD9. Only the bits [127 ... 1] of the CID and CSD are transmitted, and the reserved bit [0] of these registers is replaced with the end bit of the response.

Table 23-12 R2 response

Bit	135	134	[133 : 128]	[127 : 1]	0
Field width	1	1	6	127	1
Value	1	0	111111	-	1
Description	Start bit	Transmission bit	Reserved	CID or CSD register	End bit

23.3.2.2.4 R3

Code length = 48 bits. The contents of the OCR register are sent as a response to ACMD41.

Table 23-13 R3 response

Bit	**47**	**46**	**[45 : 40]**	**[39: 8]**	**[7: 1]**	**0**
Field width	1	1	6	32	7	1
Value	1	0	111111	-	111111	1
Description	Start bit	Transmission bit	Reserved	OCR register	Reserved	End bit

23.3.2.2.5 R4 (Fast I/O)

Code length = 48 bits. The parameter field contains the RCA of the specified card, the register address to be read out or written to, and its contents.

Table 23-14 R4 response

Bit	**47**	**46**	**[45: 40]**	**[39: 8]**			**[7: 1]**	**0**
Field width	1	1	6	16	8	8	7	1
Value	1	0	100111	-	-	-	-	1
Description	Start bit	Transmission bit	CMD39	RCA	Register address	Read register contents	CRC7	End bit

23.3.2.2.6 R4b

For SD I/O only, an SDIO card will respond with a unique SDIO response R4 after receiving the CMD5.

Table 23-15 R4b response

Bit	**47**	**46**	**[45: 40]**			**[39: 8]**			**[7: 1]**	**0**
Field width	1	1	6	1	3	1	3	24	7	1
Value	1	0	-	-	-	-	-	-	-	1
Description	Start bit	Tx bit	Res.	Card ready	Numberof I/O functions	Current memory	Stuff bit	I/O OCR	Res.	End bit

23.3.2.2.7 R5 (interrupt request)

For MultiMedia card only. Code length = 48 bits. If the response is generated by the host, the RCA field in the parameter will be 0x0.

Table 23-16 R5 response

Bit	47	46	[45: 40]		[39: 8]	[7: 1]	0
Field width	1	1	6	16	16	7	1
Value	1	0	101000	-	-	-	1
Description	Start bit	Start bit	Tx bit	RCA[31:16] of a successful card or of the host	Not defined. Can be used as interrupt data	CRC7	End bit

23.3.2.2.8 R6 (interrupt request)

For SD I/O card only. this is a normal response to CMD3 by a memery device.

Table 23-17 R6 response

Bit	47	46	[45: 40]		[39: 8]	[7: 1]	0
Field width	1	1	6	16	16	7	1
Value	1	0	000011	-	-	-	1
Description	Start bit	Tx bit	CMD3	RCA[31:16] of a successful card or of the host	Card status	CRC7	End bit

The card status bit [23: 8] will be changed when the CMD3 is sent to an I/O-only card. In this case, the 16 bits of response are the SD I/O-only values.

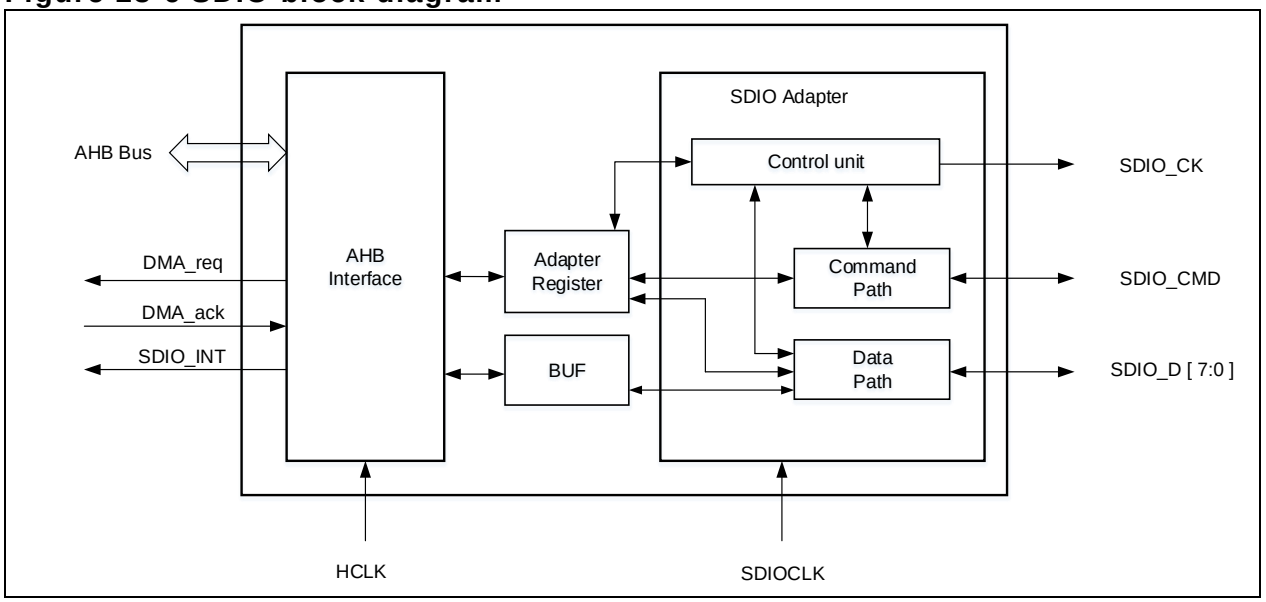
- Bit 15=COM_CRC_ERROR
- Bit 14=ILLEGAL_COMMAND
- Bit 13=ERROR
- Bit [12: 0]=Reserved

23.3.3 SDIO functional description

SDIO consists of four parts:

- SDIO adapter block: contains a control unit, command path and data path that provides all functions specific to the MMC/SD/SD I/O card such as the clock generation, command and data transfer
  - Control unit: manages and generates clock signals
  - Command path: manages command transfer
  - Data path: manages data transfer
- AHB interface: generates interrupt and DMA request signals
- Adapter register: system register
- BUF: used for data transfer

Figure 23-6 SDIO block diagram



23.3.3.1 SDIO adapter

SDIO_CK is a clock to the MultiMedia/SD/SDIO car provided by the host. One bit of command or data is transferred on both command and data lines with each clock cycle. The clock frequency can very between different cards and different protocols.

- MultiMedia card
  - V3.31 protocol 0 – 20MHz
  - V4.0/4.2 protocol 0 – 50MHz
- SD card
  - 0 – 50MHz
- SD I/O card
  - 0 – 50MHz

SDIO_CMD is a bidirectional command channel and used for the initialization of a card and command transfer. When the host sends a command to a card, the card will issue a response to the host. The SDIO_CMD has two operational modes:

- Open-drain mode for initialization (only for MMCV3.31 or previous)
- Push-pull mode for command transfer (SD/SD I/O card and MMC V4.2 also use push-pull drivers for initialization)

SDIO_D [7:0] is a bidirectional data channel. After initialization, the host can change the width of the data bus. After reset, the SDIO_D0 is used for data transfer by default. MMCV3.31 or previous supports only one bit of data line, so only SDIO_DO can be used.

The table below is used for the MultiMedia card/SD/SD I/O card bus:

Table 23-18 SDIO pin definitions

Pin	Direction	Description
SDIO_CK	Output	MultiMedia card/SD/SDIO card clock. This pin is the clock from the host to a card.
SDIO_CMD	Bidirectional	MultiMedia card/SD/SDIO card command. This pin is the bidirectional command/response signal .
SDIO_D[7: 0]	Bidirectional	MultiMedia card/SD/SDIO card data. This pin is the bidirectional databus.

Control unit

The control unit consists of a power management sub-unit and a clock management sub-unit. The power management subunit is controlled by the SDIO_PWRCTRL register. The PS bit is used to define power-up/power-off state. During the power-off and power-up phases, the power management subunit will disable the card bus output signals. The clock management subunit is controlled by the SDIO_CLKCTRL

register where the CLKDIV bit is used to define the divider factor between the SDIOCLK and the SDIO output clock. If BYPSEN = 0, the SDIO_CK output signal is driven by the SDIOCLK divided according to the CLKDIV bit; if BYPSEN = 1, the SDIO_CK output signal is directly driven by the SDIOCLK. The HFCEN is set to enable hardwar flow control feature in order to avoid the occurrence of an error at transmission underflow or reception overflow. The PWRSVEN bit can be set by software to enable power save mode, and the SDIO_CK can be output only when the bus is active.

Command path

The command path unit sends commands to and receives responses from the cards. When the CCSMEN bit is set in the SDIO_CMDCTRL register, a command transfer starts. First sends a command to a card by the SDIO_CMD, the command length is 48 bits. The data on the SDIO_CMD is synchronized with the rising edge of the SDIO_CK. A block of data is transferred with each SDIO_CK, including start bit, transfer bit, command index defined by the SDIO_CMDCTRL_CMDIDX bit, parameters defined by the SDIO_ARG, 7-bit CRC and end bit. Then receives responses from the card. There are two response types: 48-bit short response and 136-bit long response. Both use CRC erro check. The received responses are saved in the area from SDIO_RSP1 to SDIO_RSP4. The command path can generate command flag, which can be defined by the SDIO_STS register.

Table 23-19 Command formats

Bit	47	46	[45: 40]	[39: 8]	[7: 1]	0
Width	1	1	6	32	7	1
Value	0	1	-	-	-	1
Description	Start bit	Tx bit	Command index	Parameter	CRC7	End bit

— Response: A response is sent from a specified card to the host (or synchronously from all cards for MMCV3.31 or previous), as an answer to a previously received command. Responses are transferred serially on the CMD line.

Table 23-20 Short response format

Bit	47	46	[45: 40]	[39: 8]	[7: 1]	0
Width	1	1	6	32	7	1
Value	0	0	-	-	-	1
Description	Start bit	Tx bit	Command index	Parameter	CRC7 (or 1111111)	End bit

Table 23-21 Long response format

Bit	135	134	[133: 128]	[127: 1]	0
Width	1	1	6	127	1
Value	0	0	111111	-	1
Description	Start bit	Tx	Reserved	CID or CSD (including internal CRC7)	End bit

Table 23-22 Command path status flags

Flag	Description
CMDRSPCMPL	A response is already received (CRC OK)
CMDFAIL	A command response is already received (CRC fails)
CMDCMPL	A command is sent (does not require a response)
CMDTIMEOUT	Command response timeout (64 SDIO_CK cycles)
DOCMD	Command transfer is in progress

Command channel state machine (CCSM)

When the CCSMEN bit is set in the SDIO_CMDCTR register, command transfer starts. When the command has been sent, the command channel state machine (CCSM) will set the status flags and enters the idle state if a response is not required. When a response is received, the received CRC code and the internally generated CRC code are compared, and the appropriate status flags are set.

- The CCSM remains in the idle state for at least 8 SDIO_CK cycles to meet the Ncc (the minimum delay beteen two host commands) and NRC (the minimum delay between the host command and the card response).
- When the wait state is entered, the command timer is enabled. if the NCR timeout (resonse time to a command), that is, 64 SDIO_CK periods, is reached before the CCSM moves to the receive state, the timeout flag is set (CMDTIMEOUT) and the idle state is entered.

If the interrupt bit is set in the command register, the timer is disabled and the CCSM waits for an interrupt request from one card. If the pending bit is set in the command register, the CCSM will enter pend state and wait for a CmdPend signal from the data path subunit. When detecting the CmdPend, the CCSM goes to the send state, which triggers the data counter to send the stop command.

Figure 23-7 Command channel state machine (CCSM)

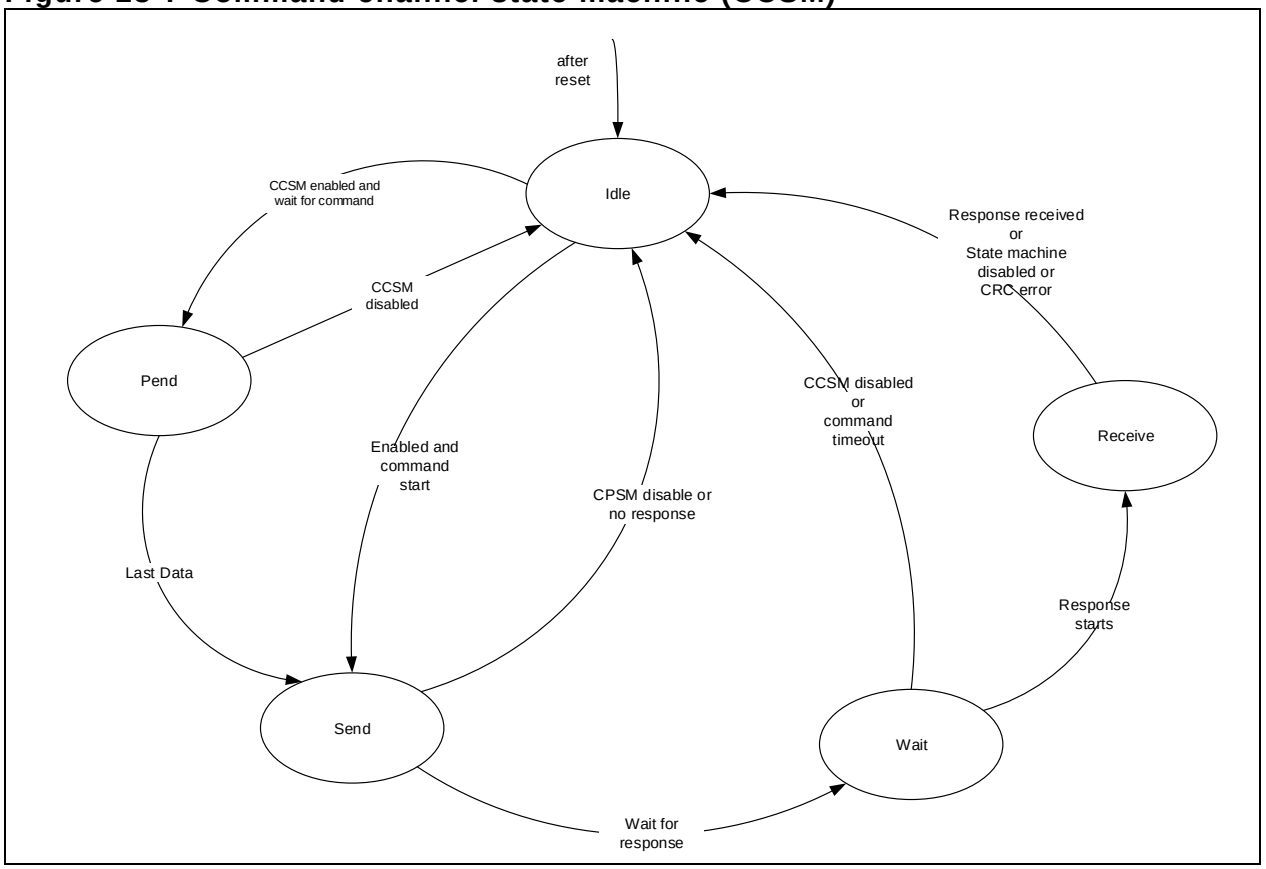


Figure 23-8 SDIO command transfer

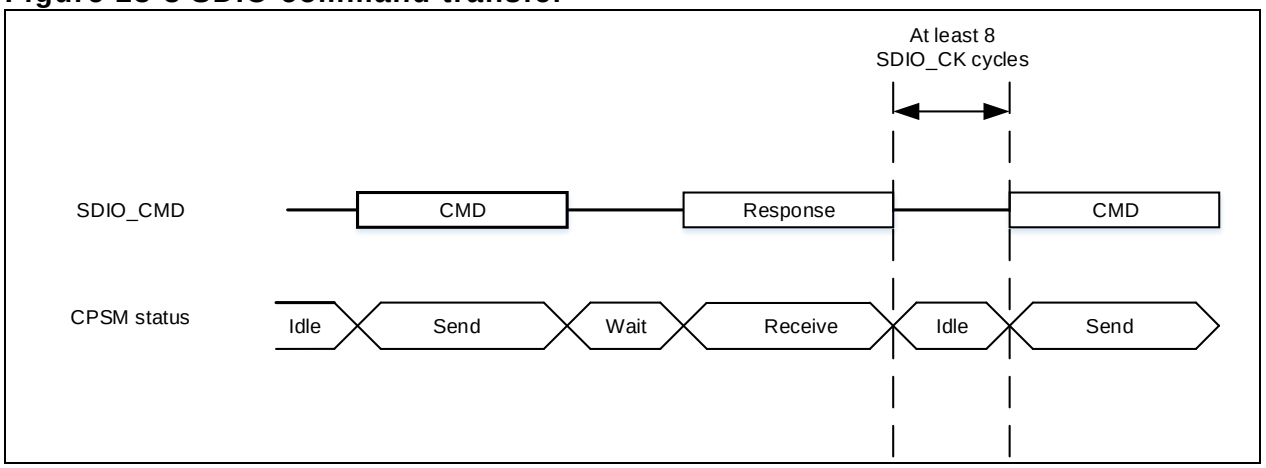


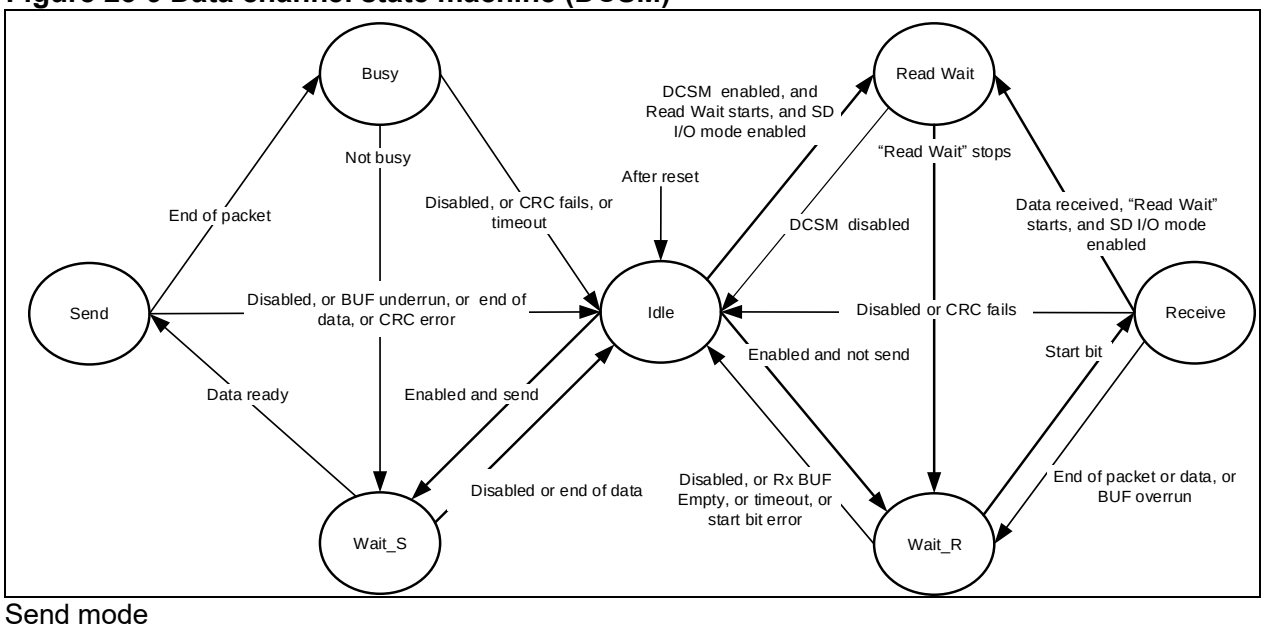
Data path

The data path subunit transfers data between the host and the cards. The databus width can be configured using the BUSWS bit in the SDIO_CLKCTRL register. By default, only the SDIO_DO signal line is used for transfer. Only one bit of data is transferred with each clock cycle. If the 4-bit wide bus mode is selected, four bits are transferred per clock cycle over the SDIO_D [3:0] signal line. If the 8-bit wide bus mode is selected, eight bits are transferred per clock cycle over the SDIO_D [7: 0] signal line. The TFRDIR bit is set in the SDIO_DTCTR register to define the transfer direction. If TFRDIR=0, it indicates that the data is transferred from the controller to the card; if TFRDIR=1, it indicates that the data is transferred from the card to the controller. The TFRMODE bit can be used to select block data transfer or stream transfer for the MultiMedia card. If the TFREN bit is set, data transfer starts. Depending on the TFRDIR bit, the DCSM enters Wait_S or Wait_R state.

Data channel state machine (DCSM)

The DCSM has seven states, in send and receive mode, as shown in the Figure below:

Figure 23-9 Data channel state machine (DCSM)



Send mode

- Idle: The data channel is inactive, either in the Wait_S or the Wait_R state.
- Wait_S: Waits until the BUF flag becomes empty or the data transmission is completed. The DCSM must remain in the Wait_S state for at leat two clock periods to meet the N_{WR} timing requirements where the N_{WR} is the interval between the reception of the card response and the start of the data transfer from the host.
- Send: The DCSM sends data to a card, and the data transfer mode can be either block or stream, depending on the SDIO_DTCTRL_TFRMODE bit. If an overflow error occurred, the DCSM then moves to the idle state

- Busy: The DCSM waits for the CRC flag. If the DCSM receives a correct CRC status and is not busy, it will enter the Wait_S state. If it does not receive a correct CRC status or a timeout occurs while the DCSM is in the busy state, a CRC fail flag or timeout flag is generated.
- Wait_R: The start bit of the Wait_R. If a timeout occurs before it detects a start bit, the DCSM moves to the idle state and generates a timeout flag.
- Receive: Data is received from a card and writtento the BUF. The data transfer mode can be either block or stream, depending on the SDIO_DTCTRL _TFRMODE bit. If an overflow error occurs, it then returns to Wait_R state.

Table 23-23 Data token formats

Description	Start bit	Data	CRC16	End bit
Block data	0	-	Y	1
Stream data	0	-	N	1

23.3.3.2 Data BUF

The data BUF contains a transmit and receive unit. It is a 32-bit wide and 32-word deep data buffer. Becase the data BUF operates in the AHB clock domain (HCLK), all signals connected to the SDIO clock domain (SDIOCLK) are resynchronized.

- **Transmit BUF:** Data can be written to the transmit BUF via the AHB interface when the SDIO transmission feature is enabled.

The transmit BUF has 32 sequential addresses. It contains a data output register that holds the data word pointed by the read pointer. When the data path has loaded its shift register, it moves its read pointer to the next data and outputs data.
If the transmit BUF is disabled, all status flags are inactive. The data path sets the DOTX when it transmits data.

- **Receive BUF:** When the data path receives a data word, it will write the data to the BUF. The write pointer is incremented automatically after the end of the wrie operation. On the other side, a read pointer always points to the current data in the BUF. If the receive BUF is disabled, all status flags are cleared, and the read and write pointers are reset as well. The data path sets the DORX when it receives data.

23.3.3.3 SDIO AHB interface

The AHB interface generates the interrupt and DMA requests, and access the SDIO interface registers and the data BUF.

SDIO interrupts

The interrupt logic generats an interrupt request when one of the selected status flags is hight. The SDIO_INTEN register is used to select the conditions that will generat an interrupt.

SDIO/DMA interface: data transfer pocess between the SDIO and memory

In the following examples, data is transferred from the host to the card. the SDIO BUF is filled with data stored in a memory through the DMA controller.

1. Card identification process
2. Increase the SDIO_CK frequency
3. Select a card by sending CMD7
4. Enable the DMA2 controller and clear all interrupt flag bits, configure the DMA2 channel4 source address register as the memory buffer's base address, and the DMA2 channel4 destination address register as the SDIO_BUF register address. Then configure the DMA2 channel4 control register (memory increment, non-peripheral increment, and peripheral and source data width is word width). Finally enable DMA2 channel4.
5. Send CMD24 (WRITE_BLOCK) as follows:

   Program the SDIO data length register (SDIO_DTLEN), the BLKSIZE bit in the SDIO data control register (SDIO_DTCTRL), and the SDIO parameter register (SDIO_ARG) with the address of the card where data is to be transferred, and program the SDIO command register (SDIO_CMD), enable the CCSMEN bit, wait for SDIO_STS [6]=CMDRSPCMPL interrupt, and then program the

SDIO data control register (SDIO_DTCTRL): TFREN=1 (enable the SDIO card host to send data), TFRDIR=0 (from the controller to the card), TFRMODE=0 (block data transfer), DMAEN=1 (enable DMA), BLKSIZE=9 (512 bytes), and wait from SDIO_STS [10]=DTBLKCMPL.

6. Check that no channesl are still enabled by confirming the DMA channel enable SDIO status register (SDIO_STS)

23.3.3.4 Hardware flow control

The HFCEN bit is set in the SDIO_CLKCTRL register to enable hardware flow control, which is sued to avoid BUF underflow and overflow errors. Read/write access to the BUF is still active even if flow control is enabled.

23.3.4 SDIO I/O card-specific operations

The SDIO can support the following operations (except read suspend, for it does not require specific hardware operation) when the SDIO_DTCTRL [11] is set.

SDIO read wait operation by SDIO_D2 siganl lines

The optional read wait operation is used only for SD card 1-bit or 4-bit mode. The read wait operation can instruct the host to stop data transfer temporarily while the host is reading from multiple registers (IO_RW_EXTENDED, CMD53), and also allows the host to send commands to other functions in the SD I/O device in order to start a read wait process after the reception of the first data block. The detailed process as follows:

- Enable data path (SDIO_DTCTRL [0] = 1)
- Enalbe SDIO-specific operation (SDIO_DTCTRL [11] = 1)
- Start read wait (SDIO_DTCTRL [10]=0 and SDIO_DTCTRL [8]=1)
- Data direction is from a card to the SDIO host (SDIO_DTCTRL [1]=1)
- The data unit in the SDIO adapter will enter read wait state, and drive the SDIO_D2 to 0 after 2 SDIO_CK cycles
- The data unit starts waiting to receive data from a card. the DCSM will not enter read wait even if read wait start is set. The read wait process will start after the CRC is received. The RDWTSTOP has to be cleared to start a new read wait operation.

Durint the read wait period, the SDIO host can detect the SDIO interrupts over the SDIO_D1.

SDIO read wait operation by stopping clock

If the SDIO card does not support the mentioned above read wait operation, the SDIO can enter a read wait by stopping SDIO_CK, described as follows:

- Enable data path (SDIO_DTCTRL [0] = 1)
- Enalbe SDIO-specific operation (SDIO_DTCTRL [11] = 1)
- Start read wait (SDIO_DTCTRL [10]=0 and SDIO_DTCTRL [8]=1)

The DCSM stos the clock two SDIO_CK cycles after the end bit of the current received data block and starts the clock again after the read wait end bit is set.

Note that as the SDIO_CK is stopped, the SDIO host cannot send any command to the card. the SDIO host can detect the SDIO interrupt over the SDIO_D1.

SDIO suspend/resume operation (write and read operation suspend)

To free the bus to provide higher-priority transfers for other functions or memories, the host can suspend data transfer to certain functions or memories. As soon as the higher-priority transfer is completed, the previous transfer operation will restart at the suspended location.

While sending data to a card, the SDIO can suspend the write operation. the SDIO_CMD [11] bit is set and indicates to the CCSM that the current command is a suspend command. The CCSM analyzes the response and when a ACK signal is received from the card (suspend accepted), it acknowledges the DCSM that enters the idle state after receiving the CRC of the current data block.

SDIO interrupts

There is a pin with interrupt feature on the SD interface in oder to enable the SD I/O card to interrupt the MultiMedia card/SD module. In 4-bit SD mode, this pin is SDIO_D1. The SD I/O interrupts are detected when the level is active. In other words, the interrupt signal line must be active (low) before it is recognized and responded by the MultiMedia card/SD module, and will remain inactive (high) at the end of the interrupt routine.

When the SDIO_DTCTRL [11] bit is set, the SDIO interrupts are detected on the SDIO_D1 signal line.

23.4 SDIO registers

The device communicates with the system through 32-bit control registers accessible via AHB.

The peripheral registers must be accessed by words (32-bit).

Table 23-24 A summary of the SDIO registers.

Register	Offset	Reset value
SDIO_PWRCTRL	0x00	0x0000 0000
SDIO_CLKCTRL	0x04	0x0000 0000
SDIO_ARG	0x08	0x0000 0000
SDIO_CMD	0x0C	0x0000 0000
SDIO_RSPCMD	0x10	0x0000 0000
SDIO_RSP1	0x14	0x0000 0000
SDIO_RSP2	0x18	0x0000 0000
SDIO_RSP3	0x1C	0x0000 0000
SDIO_RSP4	0x20	0x0000 0000
SDIO_DTTMR	0x24	0x0000 0000
SDIO_DTLEN	0x28	0x0000 0000
SDIO_DTCTRL	0x2C	0x0000 0000
SDIO_DTCNTR	0x30	0x0000 0000
SDIO_STS	0x34	0x0000 0000
SDIO_INTCLR	0x38	0x0000 0000
SDIO_INTEN	0x3C	0x0000 0000
SDIO_BUFCNTR	0x48	0x0000 0000
SDIO_BUF	0x80	0x0000 0000

23.4.1 SDIO power control register (SDIO_ PWRCTRL)

Bit	Register	Reset value	Type	Description
Bit 31: 2	Reserved	0x0000 0000	resd	Kept at its default value.
Bit 1: 0	PS	0x0	rw	Power switch These bits are set or cleared by software. They are used to define the current status of the card clock. 00: Power-off, the card clock is stopped. 01: Reserved 10: Reserved 11: Power-on, the card clock is started.

Note: Write access to this register is not allowed within seven HCLK clock periods after data is written.

23.4.2 SDIO clock control register (SDIO_ CLKCTRL)

The SDIO_CLKCTRL register controls the SDIO_CK output clock.

Bit	Register	Reset value	Type	Description
Bit 31: 17	Reserved	0x0000	resd	Kept at its default value.
Bit 16: 15	CLKDIV	0x0	rw	Clock division This field is set or cleared by software. It defines the clock division relations between the SDIOCLK and the SDIO_CK: SDIO_CK frequency=SDIOCLK / [CLKDIV[9: 0] + 2].
Bit 14	HFCEN	0x0	rw	Hardware flow control enable This bit is set or cleared by software. 0: Hardware flow control disabled 1: Hardware flow control enabled Note: When hardware flow control is enabled, refer to the SDIO_STS register for the meaning of the TXBUF_E and RXBUF_F interrupt signals.
Bit 13	CLKEGS	0x0	rw	SDIO_CK edge selection This bit is set or cleared by software. 0: SDIO_CK generated on the rising edge of the master clock SDIOCLK 1: SDIO_CK generated on the falling edge of the master clock SDIOCLK
Bit 12: 11	BUSWS	0x0	rw	Bus width selection This bit is set or cleared by software. 00: Default bus mode, SDIO_D0 used 01: 4-bit bus mode,SDIO_D[3: 0] used 10: 8-bit bus mode, SDIO_D[7: 0] used
Bit 10	BYPSEN	0x0	rw	Clock divider bypass enable bit This bit is set or cleared by software. When disabled, the SDIO_CK output signal is driven by the SDIOCLK that is divided according to the CLKDIV value. When enabled, the SDIO_CK output signal is directly driven by the SDIOCLK. 0: Clock divider bypass disabled 1: Clock divider bypass enabled
Bit 9	PWRSVEN	0x0	rw	Power saving mode enable This bit is set or cleared by software. When disabled, the SDIO_CK is always output; when enabled, the SDIO_CK is only output when the bus is active. 0: Power saving mode disabled 1: Power saving mode enabled
Bit 8	CLKOEN	0x0	rw	Clock output enable This bit is set or cleared by software. 0: Clock output disabled 1: Clock output enabled
Bit 7: 0	CLKDIV	0x00	rw	Clock division This field is set or cleared by software. It defines the clock division relations between the SDIOCLK and the SDIO_CK: SDIO_CK frequency=SDIOCLK / [CLKDIV[9: 0] + 2].

Note: 1. While the SD/SDIO card or MultiMedia car is in identification mode, the SDIO_CK freqeuency must be less than 400kHz.

2. When all card are assigned with relative card addresses, the clock frequency can be changed to the maxmimum card frequency.

*3. This register cannot be written within seven HCLK clock periods after data is written. The SDIO_CK can be stopped during the read wait period for SD I/O cards. In this case, the SDIO_*

CLKCTRL register does not control the SDIO_CK.

23.4.3 SDIO argument register (SDIO_ARG)

The SDIO_ARG register contains 32-bit command argument, which is sent to a card as pat of a command.

Bit	Register	Reset value	Type	Description
Bit 31: 0	ARGU	0x0000 0000	rw	Command argument Command argument is sent to a card as part of a command. If a ommand contains an argument, it must be loaded into this register before writing a command to the command register.

23.4.4 SDIO command register (SDIO_CMD)

The SDIO_CMD register contains the command index and command type bits. The command index is sent to a card as part of a command. The command type bits control the command channel state machine (CCSM).

Bit	Register	Reset value	Type	Description
Bit 31: 12	Reserved	0x00000	resd	Kept at its default value.
Bit 11	IOSUSP	0x0	rw	SD I/O suspend command This bit is set or cleared by software. If this bit is set, the command to be sent is a suspend command (used for SDIO only). 0: SD I/O suspend command disabled 1: SD I/O suspend command enabled
Bit 10	CCSMEN	0x0	rw	Command channel state machine (CCSM) enable bit This bit is set or cleared by software. 0: Command channel state machine disabled 1: Command channel state machine enabled
Bit 9	PNDWT	0x0	rw	CCSM Waits for ends of data transfer (CmdPend internal signal) This bit is set or cleared by software. If this bit is set, the CCSM waits for the end of data transfer before it starts sending a command. 0: Disabled 1: Enabled
Bit 8	INTWT	0x0	rw	CCSM waits for interrupt request This bit is set or cleared by software. If this bit is set, thE CCSM disables command timeout and waits for an interrupt request. 0: Disabled 1: Enabled
Bit 7: 6	RSPWT	0x0	rw	Wait for response bits This bit is set or cleared by software. This bit indicates whether the CCSM is to wait for a response, and if yes, it will indicates the response type. 00: No response 01: Short response 10: No response 11: Long response
Bit 5: 0	CMDIDX	0x00	rw	Command index The command indes is sent to a card as part of a command.

Note: 1.This register cannot be written withing sevel HCLK clock periods after data is written.
2.MultiMedia card can sent two types of responses: 48-bit short response or 136-bit short response. The SD card and SD I/O card can send only short responses, and the argument

can vary according to the type of response. The software will distinguish the tpe fo response accorind to the command sent.

23.4.5 SDIO command response register (SDIO_RSPCMD)

The SDIO_RSPCMD register contains the command index of the last command response received. If the command response transmiision does not contain the command index (long or OCR response), the SDIO_RSPCMD field is unknon, alghout it should have contained 111111b (the value of the reserved field from a response)

Bit	Register	Reset value	Type	Description
Bit 31: 6	Reserved	0x0000000	resd	Kept at its default value.
Bit 5: 0	RSPCMD	0x00	ro	Response command index This field contains the command indes of the command response received.

23.4.6 SDIO response 1..4 register (SDIO_RSPx)

The SDIO_RSPx (x=1..4) register contains the status of a card, which is parf ot the response received.

Bit	Register	Reset value	Type	Description
Bit 31: 0	CARDSTSx	0x0000 0000	ro	See Table 23-25

The card status size is 32 or 127 bits, dependion on the response type.

Table 23-25 Response type and SDIO_RSPx register

Register	Short response	Long response
SDIO_RSP1	Card status [31: 0]	Card status [127: 96]
SDIO_RSP2	Unused	Card status [95: 64]
SDIO_RSP3	Unused	Card status [63: 32]
SDIO_RSP4	Unused	Card status [31: 1]

The most significant bit of the card status is always received first. The least significant bit of the SDIO_RSP4 register is always 0.

23.4.7 SDIO data timer register (SDIO_DTTMR)

The SDIO_DTTMR register contains the data timeout period in the unit of card bus clock periods. A counter loads the value from the SDIO_DTTMR register and starts decrementing when the DCSM enters the Wait_R or busy state. If the counter reaches 0 while the DCSM is in either of these states, a timeout status flag will be set.

Bit	Register	Reset value	Type	Description
Bit 31: 0	TIMEOUT	0x0000 0000	rw	Data timeout period Data timeout period in card bus clock cycles.

Note: A data transfer must be written to the SDIO_DTCNTR and the SDIO_DTLEN register before being written to the SDIO data control register (SDIO_DTCTRL).

23.4.8 SDIO data length register (SDIO_DTLEN)

The SDIO_DTLEN register contains the number of data bytes to be transferred. the value is loaded into the data counter when data transfer starts.

Bit	Register	Reset value	Type	Description
Bit 31: 25	Reserved	0x00	resd	Kept at its default value.
Bit 24: 0	DTLEN	0x0000000	rw	Data length value Number of data bytes to be transferred.

Note: For a block data transfer, the value in the SDIO_DTLEN msut be a multiple of the block data size (See 23.4.9 SDIO_DTCTRL register). It is mandatory to write the SDIO_DTTMR and SDIO_DTLEN register before writing the SDIO_DTCTRL register for data transfer.

23.4.9 SDIO data control register (SDIO_DTCTRL)

The SDIO_DTCTRL register controls the data channel statue machine (DCSM).

Bit	Register	Reset value	Type	Description
Bit 31: 12	Reserved	0x00000	resd	Kept at its default value.
Bit 11	IOEN	0x0	rw	SD I/O enable functions This bit is set or cleared by software. If the bit is set, the DCSM performs an SD IO card-specific operation. 0: Disabled 1: Enabled
Bit 10	RDWTMODE	0x0	rw	Read wait mode This bit is set or cleared by software. If disabled, the SDIO_D2 contols the read wait; if enabled, the SDIO_CK controls the read wait. 0: Disabled 1: Enabled
Bit 9	RDWTSTOP	0x0	rw	Read wait stop This bit is set or cleared by software.While the the RDWTSTART is set, If this bit is set, it indicates that read wait is stopped; if this bit cleared, it indicates that the read wait is in progress. 0: Read wait is in progress if the RDWTSTART is set. 1: Read wait is stopped if the RDWTSTART is set.
Bit 8	RDWTSTART	0x0	rw	Read wait start This bit is set or cleared by software. When this bit is set, read wait starts; when this bit is cleared, no ations occurs. 0: Read wait disabled 1: Read wait enabled
Bit 7: 4	BLKSIZE	0x0	rw	Data block size his bit is set or cleared by software. This field defines the length of data block when the block datat transfer is selected. 0000: block length = 2^0 = 1 byte 0001: block length = 2^1 = 2 bytes 0010: block length = 2^2= 4 bytes 0011: block length = 2^3= 8 bytes 0100: block length = 2^4= 16 bytes 0101: block length = 2^5= 32 bytes 0110: block length = 2^6= 64 bytes 0111: block length = 2^7= 128 bytes 1000: block length = 2^8= 256 bytes 1001: block length = 2^9= 512 bytes 1010: block length = 2^{10}= 1024 bytes 1011: block length = 2^{11}= 2048 bytes 1100: block length = 2^{12}= 4096 bytes 1101: block length = 2^{13}= 8192 bytes 1110: block length = 2^{14} = 16384 bytes 1111: Reserved
Bit 3	DMAEN	0x0	rw	DMA enable bit This bit is set or cleared by software. 0: Disabled 1: Enabled
Bit 2	TFRMODE	0x0	rw	Data transfer mode selection This bit is set or cleared by software. If this bit is set, it indicates stread data transfer; if this bit cleared, it indicates

				block data transfer. 0: Disabled 1: Enabled
Bit 1	TFRDIR	0x0	rw	Data transfer direction selection This bit is set or cleared by software. If this bit is set, data transfer is from a card to a controller; if this bit is cleared, data transfer is from a controlle to a card. 0: Disabled 1: Enabled
Bit 0	TFREN	0x0	rw	Data transfer enabled bit This bit is set or cleared by software. If this bit is set, data transfer starts. The DCSM enters the Wait_S or Wait_R state, depending on the direction bit TFRDIR. The DCSM goes to the read wait state if the RDWTSTART bit is set from the beginning of the transfer. It is not necessary to clear the enable bit after the end of data transfer but the SDIO_DTCTRL must be updated to enable a new data transfer. 0: Disabled 1: Enabled

Note: This register cannot be written within seven HCLK clock periods after data is written.

23.4.10 SDIO data counter register (SDIO_DTCNTR)

The SDIO_DTCNTR register loads the value from the SDIO_DTLEN register (see 23.4.8) when the DCSM moves from the idle state to the Wait_R or Wait_S state. During the data transfer, the counter value decrements to 0, and then the DCSM enters the idle state and sets the data status end flag bit DTCMPL.

Bit	Register	Reset value	Type	Description
Bit 31: 25	Reserved	0x00	resd	Kept at its default value.
Bit 24: 0	CNT	0x0000000	ro	Data count value When this register is read, the number of data bytes to be transferred is returned. Write access has no effect.

Note: This register can be read only when the data transfer is complete.

23.4.11 SDIO status register (SDIO_STS)

The SDIO_STS register is a read-only register, containing two types of flags:

- Static flags (bits [23: 22, 10: 0]): These bits can be cleared by writing to the SDIO_INTCLR register (see 23.4.12).
- Dynamic flags (bit [21: 11]): These bit status changes with the state of the corresponding logic (for example, BUT full or empty flag is set or cleared as data written to the BUF)

Bit	Register	Reset value	Type	Description
Bit 31: 23	Reserved	0x000	resd	Kept at its default value.
Bit 22	IOIF	0x0	ro	SD I/O interrupt received
Bit 21	RXBUF	0x0	ro	Data available in receive BUF
Bit 20	TXBUF	0x0	ro	Data available in transmit BUF
Bit 19	RXBUFE	0x0	ro	Receive BUF empty
Bit 18	TXBUFE	0x0	ro	Transmit BUF empty If hardware flow control is enabled, the TXBUF_E signal becomes valid when the BUF contains two words.
Bit 17	RXBUFF	0x0	ro	Receive BUF full If hardware flow control is enabled, the RXBUF_F becomes valid two words before the BUF is full.
Bit 16	TXBUFF	0x0	ro	Transmit BUF full
Bit 15	RXBUFH	0x0	ro	Receive BUF half full There are at least 8 words in the BUF. This flag bit can be

				used as DMA request.
Bit 14	TXBUFH	0x0	ro	Transmit BUF half empty: At least 8 words can be written to the BUF. This flag bit can be used as DMA request.
Bit 13	DORX	0x0	ro	Data receive in progress
Bit 12	DOTX	0x0	ro	Data transmit in progress
Bit 11	DOCMD	0x0	ro	Command transfer in progress
Bit 10	DTBLKCMPL	0x0	ro	Data block sent/received CRC check passed）
Bit 9	SBITERR	0x0	ro	Start bit not detected on all data signals in wide bus mode
Bit 8	DTCMPL	0x0	ro	Data end (data counter, SDIO CNT, is zero)
Bit 7	CMDCMPL	0x0	ro	Command sent (no response required）
Bit 6	CMDRSPCMPL	0x0	ro	Command response (CRC check passed)
Bit 5	RXERRO	0x0	ro	Received BUF overrun error
Bit 4	TXERRU	0x0	ro	Transmit BUF underrun error
Bit 3	DTTIMEOUT	0x0	ro	Data timeout
Bit 2	CMDTIMEOUT	0x0	ro	Command response timeout The command timeout is a fixed value of 64 SDIO_CK clock periods.
Bit 1	DTFAIL	0x0	ro	Data block sent/received (CRC check failed)
Bit 0	CMDFAIL	0x0	ro	Command response received (CRC check failed)

23.4.12 SDIO clear interrupt register (SDIO_INTCLR)

The SDIO_INTCLR is a read-only register. Writing 1 to the corresponding register bit will clear the correspond bit in the SDIO_STS register.

Bit	Register	Reset value	Type	Description
Bit 31: 23	Reserved	0x000	resd	Kept at its default value.
Bit 22	IOIF	0x0	rw	SD I/O interface flag clear bit This bit is set by software to clear the IOIF flag.
Bit 21: 11	Reserved	0x000	resd	Kept at its default value.
Bit 10	DTBLKCMPL	0x0	rw	DTBLKCMPL flag clear bit This bit is set by software to clear the DTBLKCMPL flag.
Bit 9	SBITERR	0x0	rw	SBITERR flag clear bit This bit is set to clear the SBITERR flag.
Bit 8	DTCMPL	0x0	rw	DTCMPL flag clear bit This bit is set by software to clear the DTCMPL flag.
Bit 7	CMDCMPL	0x0	rw	CMDCMPL flag clear bit This bit is set by software to clear the CMDCMPL flag.
Bit 6	CMDRSPCMPL	0x0	rw	MDRSPCMPL flag clear bit This bit is set by software to clear the CMDRSPCMPL flag.
Bit 5	RXERRO	0x0	rw	RXERRO flag clear bit This bit is set by software to clear the RXERRO flag.
Bit 4	TXERRU	0x0	rw	TXERRU flag clear bit This bit is set by software to clear the TXERRU flag.
Bit 3	DTTIMEOUT	0x0	rw	DTTIMEOUT flag clear bit This bit is set by software to clear the DTTIMEOUT flag.
Bit 2	CMDTIMEOUT	0x0	rw	CMDTIMEOUT flag clear bit This bit is set by software to clear the CMDTIMEOUT flag.
Bit 1	DTFAIL	0x0	rw	DTFAIL flag clear bit This bit is set by software to clear the DTFAIL flag.
Bit 0	CMDFAIL	0x0	rw	CMDFAIL flag clear bit This bit is set by software to clear the CMDFAIL flag.

23.4.13 SDIO interrupt mask register (SDIO_INTEN)

The SDIO_INTEN register determines which status bit generates an interrupt by setting the corresponding bit.

Bit	Register	Reset value	Type	Description
Bit 31: 23	Reserved	0x000	resd	Kept at its default value.
Bit 22	IOIFIEN	0x0	rw	SD I/O mode received interrupt enable This bit is set or cleared by software to enable/disable the SD I/O mode received interrupt function. 0: Disabled 1: Enabled
Bit 21	RXBUFIEN	0x0	rw	Data available in RxBUF interrupt enable This bit is set or cleared by software to enable/disable the Data Available in RxBUF Interrupt. 0: Disabled 1: Enabled
Bit 20	TXBUFIEN	0x0	rw	Data available in TxBUF interrupt enable This bit is set or cleared by software to enable/disable the Data Available in TxBUF Interrupt. 0: Disabled 1: Enabled
Bit 19	RXBUFEIEN	0x0	rw	RxBUF empty interrupt enable This bit is set or cleared by software to enable/disable the RxBUF empty interrupt. 0: Disabled 1: Enabled
Bit 18	TXBUFEIEN	0x0	rw	TxBUF empty interrupt enable This bit is set or cleared by software to enable/disable the TxBUF empty interrupt. 0: Disabled 1: Enabled
Bit 17	RXBUFFIEN	0x0	rw	RxBUF full interrupt enable This bit is set or cleared by software to enable/disable the RxBUF full interrupt. 0: Disabled 1: Enabled
Bit 16	TXBUFFIEN	0x0	rw	TxBUF full interrupt enable This bit is set or cleared by software to enable/disable the TxBUF full interrupt. 0: Disabled 1: Enabled
Bit 15	RXBUFHIEN	0x0	rw	RxBUF half full interrupt enable This bit is set or cleared by software to enable/disable the RxBUF half full interrupt. 0: Disabled 1: Enabled
Bit 14	TXBUFHIEN	0x0	rw	TxBUF half empty interrupt enable This bit is set or cleared by software to enable/disable the TxBUF half empty interrupt. 0: Disabled 1: Enabled
Bit 13	DORXIEN	0x0	rw	Data receive acting interrupt enable This bit is set or cleared by software to enable/disable the Data receive acting interrupt. 0: Disabled

				1: Enabled
Bit 12	DOTXIEN	0x0	rw	Data transmit acting interrupt enable This bit is set or cleared by software to enable/disable the Data transmit acting interrupt. 0: Disabled 1: Enabled
Bit 11	DOCMDIEN	0x0	rw	Command acting interrupt enable This bit is set or cleared by software to enable/disable the Command acting interrupt. 0: Disabled 1: Enabled
Bit 10	DTBLKCMPLIEN	0x0	rw	Data block end interrupt enable This bit is set or cleared by software to enable/disable the Data block end interrupt. 0: Disabled 1: Enabled
Bit 9	SBITERRIEN	0x0	rw	Start bit error interrupt enable This bit is set or cleared by software to enable/disable the Start bit error interrupt. 0: Disabled 1: Enabled
Bit 8	DTCMPLIEN	0x0	rw	Data end interrupt enable This bit is set or cleared by software to enable/disable the Data end interrupt. 0: Disabled 1: Enabled
Bit 7	CMDCMPLIEN	0x0	rw	Command sent interrupt enable This bit is set or cleared by software to enable/disable the Command sent interrupt. 0: Disabled 1: Enabled
Bit 6	CMDRSPCMPLIEN	0x0	rw	Command response received interrupt enable This bit is set or cleared by software to enable/disable the Command response received interrupt. 0: Disabled 1: Enabled
Bit 5	RXERROIEN	0x0	rw	RxBUF overrun error interrupt enable This bit is set or cleared by software to enable/disable the RxBUF overrun error interrupt. 0: Disabled 1: Enabled
Bit 4	TXERRUIEN	0x0	rw	TxBUF underrun error interrupt enable This bit is set or cleared by software to enable/disable the TxBUF underrun error interrupt. 0: Disabled 1: Enabled
Bit 3	DTTIMEOUTIEN	0x0	rw	Data timeout interrupt enable This bit is set or cleared by software to enable/disable the Data timeout interrupt. 0: Disabled 1: Enabled
Bit 2	CMDTIMEOUTIEN	0x0	rw	Command timeout interrupt enable This bit is set or cleared by software to enable/disable the Command timeout interrupt. 0: Disabled

				1: Enabled
Bit 1	DTFAILIEN	0x0	rw	Data CRC fail interrupt enable This bit is set or cleared by software to enable/disable the Data CRC fail interrupt. 0: Disabled 1: Enabled
Bit 0	CMDFAILIEN	0x0	rw	Command CRC fail interrupt enable This bit is set or cleared by software to enable/disable the Command CRC fail interrupt. 0: Disabled 1: Enabled

23.4.14 SDIOBUF counter register (SDIO_BUFCNTR)

The SDIO_BUFCNTR register contains the number of words to be written to or read from the BUF. The BUF counter loads the value from the SDIO_DTLEN register (see 23.4.8) when the data transfter bit TFREN is set in the SDIO_DTCTRL register. If the data length is not word-aligned, the remaining 1 to 3 bytes are regarded as a word.

Bit	Register	Reset value	Type	Description
Bit 31: 24	Reserved	0x00	resd	Kept at its default value.
Bit 23: 0	CNT	0x000000	ro	Number of words to be written to or read from the BUF.

23.4.15 SDIO data BUF register (SDIO_BUF)

The receive and data BUF is group of a 32-bit wide registers that can be written or read. The BUF contains 32 registers on 32 sequential addresses. The CPU can use BUF for read/write multiple operations.

Bit	Register	Reset value	Type	Description
Bit 31: 0	DT	0x0000 0000	rw	Receive and transmit BUF data The BUF data occupies 32x 32-bit words, the address: SDIO base + 0x80 to SDIO base + 0xFC

24 Debug (DEBUG)

24.1 Debug introduction

Cortex®-M4F core provides poweful debugging features including halt and single step support, as well as trace function that is used for checking the details of the program execution. The debug features are implemented with two interfaces: serial wire debug (SWD) and JTAG debug port. Trace information is collected by a single-wire serial wire view interface, or by TRACE interface when a larger trace bandwidth is needed. Trace and debugging interfaces can be combined into one interface.

ARM Cortex®-M4F reference documentation:

- Cortex®-M4 Technical Reference Manual (TRM)
- ARM Debug Interface V5
- ARM CoreSight Design Kit revision r1p0 Technical Reference Manual

24.2 Debug and Trace

It is possible to support debugging for different peripherals, and configure the working status of peripherals during debugging. For timers and watchdogs, the user can select whether or not to stop or continue counting during debugging; For CAN, the user can select whether or not to stop or continue updating receive registers during debugging; For I2C, the user can select whether or not to stop or continue SMBUS timeout counting.

In addition, code debugging is supported in Low-Power mode. In Sleep mode, the clock programmed by code remains active for HCLK and FCLK to continue to work. In DeepSleep mode, HICK oscillator is enabled to feed FCLK and HCLK.

There are several ID codes inside the MCU, which is accessible by the debugger using the DEBUG_IDCODE at address 0xE0042000. It is part of the DEBUG and is mapped on the external PPB bus. These codes are accessible using the JTAG debug port or the SWD debug port or by the user software. They are even accessible while the MCU is under system reset.

Two trace interface modes supported: single-pin mode for serial wire view and multi-pin trace interface.

24.3 I/O pin control

SWJ-DP is supported in different packages of AT32F413. It uses 5 general-purpose I/O ports. After reset, the SWJ-DP can be immediately used by the debugger as a default function. To ensure that JTAG input pins are not floating (especially SWCLK/JTCK), the JTAG input pins are embedded with internal pull-up or pull-down feature, NJTRST, JTDI and JTMS/SWDIO with internal pull-up feature, and JTCK/SWCLK with internal pull-down feature.

When the user wants to switch to a different debug port or disable debug feature, either IOMUX_MAPR or IOMUX_MAPR7 register can be configured to release these dedicated I/O pins. Once a corresponding debug I/O is released by the user, the GPIO controller takes control, and then these I/Os can be used as general-purpose I/Os.

For trace feature, it is possible to set the TRACE_IOEN and TRACE_MODE bits in the DEBUG_CTRL register to enable trace function and slect trace modes.

Table 24-1 Trace function enable

TRACE_IOEN	Description
0	No Trace (default state)
1	Trace enabled

Table 24-2 Trace function mode

TRACE_MODE[1: 0]		PB3/JTDO/TRACESWO	PE2/TRACECK	PE3/TRACED[0]	PE4/TRACED[1]	PE5/TRACED[2]	PE6/TRACED[3]
00	Asynchronous trace	TRACESWO	Released (can be used as general-puspose I/Os)				
01	Synchronous trace	Released (can be used as general-puspose I/Os)	TRACECK	TRACED[0]	Released (can be used as general-puspose I/Os)		
10	Synchronous trace		TRACECK	TRACED[0]	TRACED[1]	Released (can be used as general-puspose I/Os)	
11	Synchronous trace		TRACECK	TRACED[0]	TRACED[1]	TRACED[2]	TRACED[3]

24.4 DEBUG registers

Table 24-3 shows debug register map and its reset values.

The peripheral registers can be accessed by words (32-bit).

Table 24-3 DEBUG register address and reset value

Register	Offset	Reset value
DEBUG_IDCODE	0xE004 2000	0xXXXX XXXX
DEBUG_CTRL	0xE004 2004	0x0000 0000

24.4.1 DEBUG device ID (DEBUG_IDCODE)

MCU integrates an ID code that is used to identify MCU's revision. The DEBUG_IDCODE register is mapped on the external PPB bus at address 0xE0042000. This code is accessible by the JTAG debug port or SW debug port or by the user code.

Bit	Register	Reset value	Type	Description
Bit 31: 0	PID	0xXXXX XXXX	ro	PID information

PID [31: 0]	AT32 part number	FLASH size	Packages
0x7003_0240	AT32F413RCT7	256KB	LQFP64
0x7003_01C1	AT32F413RBT7	128KB	LQFP64
0x7003_0242	AT32F413CCT7	256KB	LQFP48
0x7003_01C3	AT32F413CBT7	128KB	LQFP48
0x7003_0244	AT32F413KCU7-4	256KB	QFN32
0x7003_01C5	AT32F413KBU7-4	128KB	QFN32
0x7003_0106	AT32F413C8T7	64KB	LQFP48
0x7003_0247	AT32F413CCU7	256KB	QFN48
0x7003_01CA	AT32F413CBU7	128KB	QFN48

24.4.2 DEBUG control register (DEBUG_CTRL)

This register is asynchronously reset by POR Reset (not reset by system reset). It can be written by the debugger under reset.

Bit	Register	Reset value	Type	Description
Bit 31	Reserved	0x0	resd	Kept at its default value.
Bit 30	TMR11_PAUSE	0x0	rw	TMR11 pause control bit 0: Work normally 1: Timer is disabled
Bit 29	TMR10_PAUSE	0x0	rw	TMR10 pause control bit 0: Work normally 1: Timer is disabled
Bit 28	TMR9_PAUSE	0x0	rw	TMR9 pause control bit 0: Work normally 1: Timer is disabled
Bit 27: 22	Reserved	0x00	resd	Kept at its default value.
Bit 21	CAN2_PAUSE	0x0	rw	CAN2 pause control bit 0: CAN2 works normally 1: CAN2 receive registers do not continue to receive data
Bit 20: 19	Reserved	0x0	resd	Kept at its default value.
Bit 18	TMR5_PAUSE	0x0	rw	TMR5 pause control bit 0: Work normally 1: Timer is disabled
Bit 17	TMR8_PAUSE	0x0	rw	TMR8 pause control bit 0: Work normally 1: Timer is disabled
Bit 16	I2C2_SMBUS_TIMEOUT	0x0	rw	I^2C2 pause control bit 0: Work normally 1: I^2C2 SMBUS timeout control is disabled
Bit 15	I2C1_SMBUS_TIMEOUT	0x0	rw	I^2C1 pause control bit 0: Work normally 1: I^2C1 SMBUS timeout control is disabled
Bit 14	CAN1_PAUSE	0x0	rw	CAN1 pause control bit 0: CAN1 works normally 1: CAN1 receive registers do not continue to receive data
Bit 13	TMR4_PAUSE	0x0	rw	TMR4 pause control bit 0: Work normally 1: Timer is disabled
Bit 12	TMR3_PAUSE	0x0	rw	TMR3 pause control bit 0: Work normally 1: Timer is disabled
Bit 11	TMR2_PAUSE	0x0	rw	TMR2 pause control bit 0: Work normally 1: Timer is disabled
Bit 10	TMR1_PAUSE	0x0	rw	TMR1 pause control bit 0: Work normally 1: Timer is disabled
Bit 9	WWDT_PAUSE	0x0	rw	Window watchdog pause control bit 0: Window watchdog works normally 1: Window watchdog is stopped
Bit 8	WDT_PAUSE	0x0	rw	watchdog pause control bit 0: Watchdog works normally 1: Watchdog is stopped

Bit 7: 6	TRACE_MODE	0x0	rw	Trace pin assignment control 00: Asynchronous mode 01: Snychronous mode with a data length of 1 10: Snychronous mode with a data length of 2 11: Snychronous mode with a data length of 4
Bit 5	TRACE_IOEN	0x0	rw	Trace pin assignment enable 0: No trace (default state) 1: Trace is enabled
Bit 4: 3	Reserved	0x0	resd	Kept at its default value.
Bit 2	STANDBY_DEBUG	0x0	rw	Debug Standby mode control bit 0: The whole 1.2V digital circuit is unpowered in Standby mode 1: The whole 1.2V digital circuit is not unpowered in Standby mode, and the system clock is provided by the internal RC oscillator (HICK)
Bit 1	DEEPSLEEP_DEBUG	0x0	rw	Debug Deepsleep mode control bit 0: In Deepsleep mode, all clcoks in the 1.2V domain are disabled. When exiting from Deepsleep mode, the internal RC oscillator (HICK) is enabled, and HICK is used as the system clock source, and the software must reprogram the system clock according to application requirements. 1: In Deepsleep mode, system clock is provided by the internal RC oscillator (HICK). When exiting from Deepsleep mode, HICK is used as the system clock source, and the software must reprogram the system clock. according to application requirements.
Bit 0	SLEEP_DEBUG	0x0	rw	Debug Sleep mode control bit 0: When entering Sleep mode, CPU HCLK clock is disabled, but other clocks remain active. When exiting from Sleep mode, it is not necessary to reprogram the clock system. 1: When entering Sleep mode, all clocks keep running.

25 Revision history

Document Revision History

Date	Version	Revision Note
2021.12.01	2.00	Initial release.
2022.06.27	2.01	1. Updated the descriptions in *Section 11.5.1 Control register1 (I2C_CTRL1)* 2. Updated *Figure 14-1* 3. Updated the descriptions of bit 0 in *Section 19.6.3 ADC control register2 (ADC_CTRL2)* 4. Updated the descriptions in *Section 20.6.7 Error management* 5. Updated the descriptions *Section 20.7.1.3 CAN transmit status register (CAN_TSTS)*
2022.11.11	2.02	1. Updated descriptions of *Chapter 7* 2. Updated descriptions of *Chapter 10* 3. Updated descriptions of *Section 12.6.1* 4. Updated descriptions of *Section 12.6.2* 5. Updated descriptions of *Chapter 14*
2023.08.02	2.03	1.Updated descriptions of *Section 5.5.1 Access protection* 2.Updated descriptions of *Section 7.4.11 IOMUX remap register6 (IOMUX_REMAP6)* 3.Updated descriptions of *Section 14 Timer* 4. Updated descriptions of *Section 12.8.3 Start bit and noise detection*

IMPORTANT NOTICE – PLEASE READ CAREFULLY

Purchasers are solely responsible for the selection and use of ARTERY's products and services, and ARTERY assumes no liability whatsoever relating to the choice, selection or use of the ARTERY products and services described herein

No license, express or implied, to any intellectual property rights is granted under this document. If any part of this document deals with any third party products or services, it shall not be deemed a license granted by ARTERY for the use of such third party products or services, or any intellectual property contained therein, or considered as a warranty regarding the use in any manner of such third party products or services or any intellectual property contained therein.

Unless otherwise specified in ARTERY's terms and conditions of sale, ARTERY provides no warranties, express or implied, regarding the use and/or sale of ARTERY products, including but not limited to any implied warranties of merchantability, fitness for a particular purpose (and their equivalents under the laws of any jurisdiction), or infringement on any patent, copyright or other intellectual property right.

Purchasers hereby agree that ARTERY's products are not designed or authorized for use in: (A) any application with special requirements of safety such as life support and active implantable device, or system with functional safety requirements; (B) any aircraft application; (C) any aerospace application or environment; (D) any weapon application, and/or (E) or other uses where the failure of the device or product could result in personal injury, death, property damage. Purchasers' unauthorized use of them in the aforementioned applications, even if with a written notice, is solely at purchasers' risk, and Purchasers are solely responsible for meeting all legal and regulatory requirements in such use.

Resale of ARTERY products with provisions different from the statements and/or technical characteristics stated in this document shall immediately void any warranty grant by ARTERY for ARTERY's products or services described herein and shall not create or expand any liability of ARTERY in any manner whatsoever.
